1 Introduction

This documentation describes the main features of the **T_EX Live 3** CD-ROM—a T_EX/L^AT_EX distribution for Unix, Windows32 and Amiga systems that includes T_EX, L^AT_EX 2_ε, METAFONT, MetaPost, Makeindex, and BIB_TE_X; and a wide-ranging set of macros, fonts and documentation conforming to the *T_EX Directory Standard* (TDS)—which can be used with nearly every T_EX setup.

This T_EX package uses the Web2c (version 7.2) implementation of the programs, which tries to make T_EXing as easy as possible, and takes full advantage of the efficient and highly customizable Kpathsea library from Karl Berry and Olaf Weber. It can be run either directly from the CD-ROM or installed on a hard disk.

Most of the runnable systems on the CD-ROM include a large set of drivers and support programs for T_EX, including dvips (PostScript driver), xdvi (X Windows previewer), dviIj (HP LaserJet driver), lacheck (L^AT_EX syntax checker), tex4ht (T_EX to HTML converter), dviconcat and dviselect, dv2dt and dt2dv (dvi to ASCII and vice versa), and Angus Duggan’s PostScript utilities.

1.1 Extensions to T_EX

The **T_EX Live** runnable systems contain three experimental extensions to normal T_EX:

1. ϵ -T_EX, which adds a small but powerful set of new primitives, and the T_EX--X_ET extensions for left to right typesetting; in default mode, ϵ -T_EX is 100% compatible with ordinary T_EX. See [texmf/etex/doc/base/etex_man.tex](#) on the CD-ROM for details.
2. pdfT_EX, which can optionally write Acrobat PDF format instead of DVI; there is no formal documentation for this yet, but the file [texmf/pdftex/plain/misc/example.tex](#) shows how it is used. The L^AT_EX hyperref package has an option ‘pdf_tex’, which turns on all the program features.
3. Ω (Omega), which works internally with 16-bit characters, using Unicode; this allows it to directly work with almost all the world’s scripts simultaneously. It also supports dynamically loaded ‘Ω Translation Processes’ (OTPs), which allow the user to define complex transformations to be performed on arbitrary streams of input. See [texmf/doc/omega/base/doc2.tex](#) for documentation.

ϵ - $\text{T}_{\text{E}}\text{X}$ is stable (version 2.0), although subsequent releases will add new functionality. $\text{pdfT}_{\text{E}}\text{X}$ (version 0.12h) and Ω (version 1.5) are under continual development; the versions on this CD-ROM are those current as of mid March 1998.

1.2 Other packages

The following complete packages are included on the CD-ROM:

- $\text{OzT}_{\text{E}}\text{X}$ for Macintosh.
- CMacTeX for Macintosh.
- Macintosh utilities (Alpha, Excalibur, etc.).
- MikTeX for Windows 95.
- emTeX for DOS and OS/2.
- The DJGPP version of the Web2c $\text{T}_{\text{E}}\text{X}$ system, which works under DOS and all Windows versions.
- $\text{T}_{\text{E}}\text{X}$ shells for Windows and DOS (Winedt, TeXtelnExtel , emTeXgi).

These are provided unchanged from CTAN, and have not been integrated in any way with the rest of the CD-ROM. To use the packages, go to the relevant directory and follow the installation instructions.

2 Structure and contents of the CD-ROM

The important CD-ROM top-level directories are listed below.

bin The $\text{T}_{\text{E}}\text{X}$ family programs, arranged in separate platform directories.

doc Documentation for **$\text{T}_{\text{E}}\text{X Live}$** .

ctug Material for the Czech/Slovak $\text{T}_{\text{E}}\text{X}$ Users Group.

FAQ Frequently Asked Questions, in English, French and German.

info Documentation in GNU 'info' format for the $\text{T}_{\text{E}}\text{X}$ system.

man Documentation in the form of Unix man pages for the $\text{T}_{\text{E}}\text{X}$ system.

source The source of all programs, including the main Web2c $\text{T}_{\text{E}}\text{X}$ and METAFONT distributions.

support Various bits of $\text{T}_{\text{E}}\text{X}$ -related software which are *not* installed by default, such as $\text{MusixT}_{\text{E}}\text{X}$, support programs, and a complete distribution of Ghostscript.

systems Packaged $\text{T}_{\text{E}}\text{X}$ systems which are separate from the main **$\text{T}_{\text{E}}\text{X Live}$** . Subdirectories in here are:

amiga Extra support programs for the Amiga.

macintosh The $\text{OzT}_{\text{E}}\text{X}$ and CMacTeX packages ready to install, plus some other utilities.

msdos DOS $\text{T}_{\text{E}}\text{X}$ packages— $\text{djgppT}_{\text{E}}\text{X}$, emTeX , and three $\text{T}_{\text{E}}\text{X}$ shells.

win32 T_EX packages for Windows 95 and NT users —MikTeX, and the editor/shell WinEdt.

wingut The GUTenberg T_EX distribution for Windows

texmf The main support tree of macros, fonts and documentation;

TUG Material about the T_EX Users Group.

winedt A ready to run installation of WinEdt for Windows 95/NT.

There are also two installation scripts for Unix systems, `instal | -cd. sh` and `instal | -pkg. sh`; we discuss them on in section `refsec:install` on p. 5.

2.1 The TDS tree

The **T_EX Live** `texmf` tree consists of various ‘collections’, each of which has a set of ‘packages’, of which there are over 400 on the CD-ROM. Normal installation allows the user to copy all of a collection to a local hard disk from the CD-ROM, but it is also possible to install just one package of a collection. The collections are:

ams The American Mathematical Society macro packages and fonts.

bibtex BIBT_EX styles and databases.

doc General guides and documentation in various formats, including HTML and PDF.

dvips Support for Rokicki’s DVI-to-PostScript driver.

etex Support for ϵ -T_EX.

fonts Font sources, metrics, PostScript and bitmap forms.

formats Eplain, RevT_EX, physxx, texsis, al latex, text1, lollipop, etc.

generic Extra macros for use with any format.

graphics Macro packages for graphics.

lang Support for non-English languages.

latex L^AT_EX, including official tools and all L^AT_EX 2_ε contributed packages.

metapost Support for MetaPost.

omega Support for Ω .

plain Macros for plain T_EX.

systems Binaries for Unix, Amiga and Win32 platforms.

texlive Basic material for the distribution.

Each of the collections is divided into *basic* (1), *recommended* (2) and *other* (3). The appendix starting on page 40 lists all the packages in alphabetical order with the collection they are found in, and a brief description. Thus all packages in collection `latex1` are what one must have to get started with L^AT_EX, packages in `latex2` are recommended for most users, and `latex3` contains optional packages. The directory `texmf/l | sts` contains lists of all files in each package (used by the installation programs).

3 Installation and use under Unix

You can use the **T_EX Live** CD-ROM in three ways:

1. You can mount the CD-ROM on your file system, adjust your PATH, and run everything off the CD-ROM; this takes very little disk space, and gives you immediate access to everything on the CD-ROM; although the performance will not be optimal, it is perfectly acceptable on, for instance, PCs running Linux.
2. You can install all or part of the system to your local hard disk; this is the best method for many people, if they have enough disk space to spare (a minimum of about 10 megabytes, or 100 megabytes for a recommended good-sized system).
3. You can install selected packages to work either with your existing T_EX system or a **T_EX Live** system you installed earlier.

Each of these methods is described in more detail in the following sections.

Warning: This CD-ROM is in ISO 9660 (High Sierra) format, with Rock Ridge and Joliet extensions. In order to take full advantage of the CD-ROM on a Unix system, your system needs to be able to use the Rock Ridge extensions. Please consult the documentation for your mount command to see if it is possible. If you have several different machines on a local network, see if you can mount the CD-ROM on one which *does* support Rock Ridge, and use this with the others.

Linux, FreeBSD, Sun, SGI and DEC Alpha systems should be able to use the CD-ROM with no problems. We would appreciate receiving detailed advice from other system users who also succeed, for future versions of this documentation.

The discussion below about installation assumes you have been able to mount the CD-ROM with full Rock Ridge compatibility.

3.1 Running T_EX Live from the CD-ROM

The organisation of Web2c means that you can run programs simply by adding the appropriate directory under `bin` on the CD-ROM to your PATH, and the support files will all be found with no further ado. The following shows the list of available systems and the corresponding directories.

DEC Alpha (3.2 and 4.0)	al pha-osf3. 2	al pha-osf4. 0
Amiga	m68000-ami gaos2. 1	
HP9000 HPUNIX 10.10	hppa11-hpux10. 10	
Linux (on Intel Pentium)	i 386-l i nux	
SGI IRIX (5.3 and 6.2)	mi ps-i ri x5. 3	mi ps-i ri x6. 2
IBM RS 6000 AIX (3.2.5 and 4.1.1)	rs6000-ai x3. 2. 5	rs6000-ai x4. 1. 1
Sun Sparc Sunos 4.1.3	sparc-sunos4. 1. 3	
Sun Sparc Solaris (2.5.1 and 2.6)	sparc-sol ari s2. 5. 1	sparc-sol ari s2. 6
Windows 95 or NT (Intel machines)	wi n32	

You may worry that when you subsequently make fonts or change configuration, things will go wrong because you cannot change files on the CD-ROM. However, you can maintain a parallel, writeable, T_EX

tree on your hard disk; this is searched before the main tree on the CD-ROM. The default location is `/usr/TeX.local`, but you can override this by setting the `TEXMFLOCAL` environment variable.

Thus `sh` or `bash` users on an Intel PC running Linux can mount the **T_EX Live** CD-ROM on `/cdrom` by issuing the command:

```
>> mount -t iso9660 /dev/cdrom /cdrom
```

Then they should include the directory containing the binaries for the given architecture into the search path by updating the `PATH` variable.

```
PATH=/cdrom/bin/i386-linux:$PATH
export PATH
```

For convenience, these statements can also be entered into the `.profile` script.

If in doubt, ask your local system support guru to help you work out how to mount your CD-ROM or which directory to use for your system.

Appropriate support files will be installed on your hard disk the first time you need them. It is a good idea to immediately run the `texconfi`g script to initialize things, and check it all works.

3.2 Installing T_EX Live to a hard disk

All of the necessary steps to install all or part of the distribution on your hard disk are achieved by mounting the CD-ROM, changing to the top-level directory, and typing:

```
>> sh install-cd.sh
```

(On some Unix systems, you may need to use `sh5` or `bsh`.) This script works by accessing lists of collections and packages from the CD-ROM, and trying to guess what sort of computer system you are on. It should start by displaying the following:

```
Initializing collections... Done.
Counting selected collections... Done.
Calculating disk space requirements for
    collections... Done.
Initializing system packages... Done.
```

It will then show the main control screen (Figure 1(a)), which lets you change four things:

1. the type of system you are on, or want to install for;
2. the collections you want to install, at the *basic*, *recommended* or *other* level;
3. the location on your hard disk to put the files;
4. some runtime behaviour features.

You choose options by typing a letter or number and pressing ‘return’. In the example, a Linux ELF system has been detected, the default of all collections to *recommended* level has been chosen, and the default installation directory is `/usr/local`; note that the disk space required for the current installation configuration is also displayed. If you make a suggested setup, you need about 100 megabytes of disk

```

(c) Customizing a collection

Figure 1: Examples of screens used by the installation script (contd.)

free; however, the basic setup will only take about 10 megabytes, and you can enhance it with selected packages as you need them.

Under the directory you choose for installation, the installation script will put the binaries in a subdirectory of `bin`, and the support tree in `texmf`.

The `options` item lets you decide whether to make new fonts be created in another location (if you want the main package mounted read-only for most users), and whether to make symbolic links for the `man` and GNU info pages in the ‘standard’ locations.

When you choose `<C>` for ‘collections’, you will see the display of available collections, the level of installation selected, and the disk space required (Figure 1(b)). You can set alternative levels of installation for each collection, ranging from *none* to *all*. You can either set this for all collections at once, or choose a particular collection and set its level (Figure 1(c)).

When you are finished, return to the main screen, and ask the installation to start. It will take each of the collections and systems that you requested, consult the list of files on the CD-ROM, and build a master list of files to transfer. These will then be copied to your hard disk. If you installed a system, an initialization sequence is now run (creating format files, etc.). When this has finished, all you need do is add the correct subdirectory of `bin` in the `TEX` installation to your path, and start using `TEX`. If you want, you can move the binaries up one level, e.g. from `/usr/local/bin/al pha-osf3.2` to `/usr/local/bin`; if you do this, however, you must edit `texmf/web2c/texmf.cnf` (see Appendix A) and change line 50:

```
TEXMFMAIN = $SELFAUTOPARENT
```

to

```
TEXMFMAIN = $SELFAUTODIR
```

If you move the binaries to another directory tree entirely, you need to edit `TEXMFMAIN` to specify the support tree explicitly, and set `TEXMFCNF` in your environment to `$TEXMFMAIN/texmf/web2c`.

3.3 Installing individual packages from TeX Live to a hard disk

You may want to use the TeX Live CD-ROM to either update an existing setup, or add features to an earlier installation from the CD-ROM. The main installation program is intended for the first time only, and subsequently you should use the `install-pkg.sh` script on the CD-ROM. Run this by mounting the CD-ROM, changing to the mounted directory, and typing

```
>> sh install-pkg.sh options
```

The script supports nine options; the first four let you set the individual package you want to install, the whole collection (i.e., `ams2`), the name of the mounted CD-ROM directory, and the name of the directory containing the list files (normally these latter two will be set automatically):

```
--package=name  
--collection=name  
--cddir=name  
--listdir=name
```

What actually happens is controlled by four more switches; the first two allow you to exclude documentation or source files from the installation, the third stops the default action of running `mktextlsr` on completion to rebuild the file database, and the last does nothing but list the files that would be installed:

```
--nodoc  
--nosrc  
--nohash  
--listonly
```

Finally, you can specify that, instead of installing the files, the script should make a tar archive in a specified location:

```
--archive=name
```

Thus, if we simply wanted to see the files that make up the package `fancyhdr` before we installed it, our command and output would be as follows:

```
>> sh install-pkg.sh --package=fancyhdr --listonly  
texmf/doc/latex/fancyhdr/fancyhdr.dvi  
texmf/doc/latex/fancyhdr/fancyhdr.tex  
texmf/lists/latex3/fancyhdr  
texmf/source/latex/fancyhdr/README  
texmf/source/latex/fancyhdr/fancyheadings.new  
texmf/tex/latex/fancyhdr/extramarks.sty  
texmf/tex/latex/fancyhdr/fancyhdr.sty  
texmf/tex/latex/fancyhdr/fi xmarks.sty
```

Other examples of usage are:

- Install the L^AT_EX package `natbib`:

```
>> sh install-pkg.sh --package=natbib
```

- Install the L^AT_EX package `alg` with no source files and no documentation:

```
>> sh install-pkg.sh --package=alg --nosrc --nodoc
```

- Install all the packages available in the *other* Plain T_EX collection:

```
>> sh install-pkg.sh --collection=plain3
```

- Place all files which are needed for PStricks in a tar file in /tmp:

```
>> sh install-pkg.sh --package=pstriks --archive=/tmp/pstriks.tar
```

3.4 The texconfig program

After the installation program has copied all files to their final locations, you can use a program called texconfig that allows you to configure the system to fit your local needs. This can be called at any other time to change your setup, with a full-screen (which requires the dialog program) or command-line interface. It should be used for all maintenance, such as changes of installed printers, or rebuilding the file database. Both modes have help text to guide you through the facilities.

4 Installation and use under Windows

This section only applies to systems running Windows 9x or NT. If you run Windows 3.1, you will have to install emTeX, DJGPP T_EX, or w_ingut (in the top level systems directory) by hand.

It is also necessary to have your Windows set up so that it uses the Microsoft Joliet extensions for reading CD-ROMs; simply look at the CD-ROM in Explorer and see whether it shows long, mixed-case, file names. If it does not, you cannot use the ready-to-run system on the CD-ROM.

This Win32 T_EX systems includes a new dvi previewer, Windvi, which is similar in usage to the established Unix xdvi. The documentation can be found in texmf/doc/windvi/windvi.html.

4.1 Running from the CD-ROM

You can run all the T_EX programs directly off the CD-ROM, and have access to all the macros and fonts immediately, at the price of a slower performance than if you install on the hard disk. To do this, you must add the bin/wi n32 directory of the CD-ROM to your PATH, using the Windows configuration software. Now you can run the programs at a command prompt, or use the shareware WinEdt editor, which runs the programs from convenient menus. Copy the entire wi nedt directory from the CD-ROM to your hard disk, and run wi nedt . exe from that copy.

Please respect the shareware status of WinEdt and register your copy if you intend to carry on using it.

4.2 Installing to your hard disk

Installation is started by running the program i nstal l . exe in the CD-ROM top level, which works by accessing lists of collections and packages from the CD-ROM. It will allow you to select the level at which each collection is installed (see section 2.1 for a description of ‘collections’ and ‘packages’, and permits you to omit the documentation and/or source segments of the packages if your disk space is

limited. You will be prompted for directories in which to install the main distribution, and your local configuration. In addition, you will be able to install a shareware T_EX editor, WinEdt, and the PostScript viewer Ghostscript.

Please respect the shareware status of WinEdt and register your copy if you intend to carry on using it.

Please be aware that the choice of cluster size on DOS disk partitions can radically affect the size of your T_EX installation. The support tree has hundreds of small files, and it is not unusual for a complete installation to take up to 4 times the amount of space used on the CD-ROM.

When installation is complete, you will have to restart Windows, and then you can either run the T_EX programs from a command prompt, or via WinEdt's menus (if you opted to install it).

5 Building on a new Unix platform

If you have a platform for which we have not provided binary sources, you will need to compile T_EX and friends from scratch. This is not as hard as it sounds. What you need is all in the directory `source` on the CD-ROM.

You should first install the support tree from the **T_EX Live** CD-ROM (do a basic install, with no system binaries chosen).

5.0.1 Prerequisites

You will need about 100 megabytes of disk space to compile all of T_EX and its support programs. You'll also need an ANSI C compiler, a make utility, a lexical scanner, and a parser generator. The GNU utilities (`gcc`, GNU make, `flex`, `bison`) are the most widely tested on different platforms. `gcc-2.7.* flex-2.4.7` and GNU make-3.72.1 or newer should work well. You may be able to work with other C compilers and make programs, but you will need a good understanding of building Unix programs to sort out problems.

5.0.2 Configuration

First, copy the directory `source` to your disk and change directory to where you placed it. Decide where the 'root' of the installation will be, e.g. `/usr/local` or `/usr/local/TeX`. Obviously you should use the same location that you specified when you installed the support tree.

Now, start the build process by running `configure` with a command-line like

```
>> ./configure --prefix=/usr/local/TeX
```

The 'prefix' directory is the one where you installed the support tree; the directory layout that will be used is as follows (where `$TEXDIR` stands for the directory you chose):

<code>\$TEXDIR/man</code>	UNIX manual pages
<code>\$TEXDIR/share/texmf</code>	main tree with fonts, macros, etc
<code>\$TEXDIR/info</code>	GNU style info manuals
<code>\$TEXDIR/bin/\$PLATFORM</code>	binaries

You can omit the use of 'share/' part for the `texmf` directory if you want, as `$TEXDIR/share/texmf` and `$TEXDIR/texmf` are auto-detected by `configure`. If you choose something different, you have to specify that directory with the `--datadir` option of `configure`.

If you want to leave out the \$PLATFORM directory level (i.e. put the binaries directly into \$TEXDIR/bin), specify the `--without-multiple-platform` option for configure.

Have a look at the output of `./configure -help` for more options you can use (such as omitting optional packages such as Ω or ϵ -TeX).

5.0.3 Running make

Make sure the shell variable `noclobber` is not set, and then type

```
>> make world
```

and relax...

It could also be useful to log all the output, e.g. by typing

```
>> sh -c "make world >world.log 2>&1" &
```

Before you think that everything is ok, please check the log file for errors (GNU make always uses the string "Error:" whenever a command returns an error code) and check if all binaries are built:

```
>> cd /usr/local/TeX/bin/i586-pc-linux-gnu
```

```
>> ls | wc
```

The result should be 179. `make world` is equivalent to `make all install strip`

If you need special privileges for `make install`, you can run two `make` jobs in separate runs:

```
>> make all
```

```
>> su
```

```
>> make install strip
```

5.0.4 Final configuration steps

Set up your `PATH` to include the directory containing the just-installed binaries (e.g. `/usr/local/TeX/bin/mips-sgi-irix6.3`); similarly, `MANPATH` and `INFOPATH` to include the relevant newly installed subdirectories, i.e. `$TEXDIR/man` and `$TEXDIR/info`.

The program `texconfig` allows you to set the defaults for hyphenation, paper size, print command, METAFONT mode, etc. You can run this command interactively and see what options it offers, or type

```
>> texconfig help
```

For example, if you are not using A4 format paper, you can make 'lettersize' the default using:

```
>> texconfig dvips paper letter
```

```
>> texconfig xdvi paper us
```

6 A user's guide to the Web2c system

Web2c contains a set of T_EX-related programs, i.e., T_EX itself, METAFONT, MetaPost, B_IB_TE_X, etc. The original implementation was by Tomas Rokicki who, in 1987, developed a first T_EX-to-C system adapting change files under Unix, which were primarily the work of Howard Trickey and Pavel Curtis. Tim Morgan became the maintainer of the system, and during this period the name changed to Web-to-C. In 1990, Karl Berry took over the work, assisted by dozens of additional contributors, and in 1997 he handed the baton to Olaf Weber. The latest result is Web2c Version 7.2, which was released in March 1998, and forms the basis of the present **T_EX Live** CD-ROM.

The Web2c 7.2 system runs on Unix, Windows 3.1, 9x/NT, DOS, Amiga and other operating systems. It uses Knuth's original sources for T_EX and other basic programs written in web and translates them into C source code. Moreover, the system offers a large set of macros and functions developed to augment the original T_EX software. The core T_EX family components are:

bibtex Maintaining bibliographies.

dmp troff to MPX (MetaPost pictures).

dvicopy Virtual font expansion.

weave web to T_EX.

The precise functions and syntax of these programs are described in the documentation of the individual packages or of Web2c itself. However, knowing a few principles governing the whole family of programs will help you to benefit optimally from your Web2c installation.

All programs honor the standard GNU options:

-help print basic usage summary.

-verbose print detailed progress report.

-version print version information, then exit.

For locating files the Web2c programs use the path searching library Kpathsea. This library uses a combination of environment variables and a few configuration files to optimize searching the T_EX directory tree. Web2c 7.2 can handle more than one directory tree simultaneously, which is useful if one wants to maintain T_EX's standard distribution and local extensions in two distinct trees. To speed up file searches the root of each tree has a file `ls-R`, containing an entry showing the name and relative pathname for all files “hanging” under that root.

6.1 Kpathsea path searching

Let us first describe the generic path searching mechanism of the Kpathsea library.

We call a *search path* a colon- or semicolon-separated list of *path elements*, which are basically directory names. A search path can come from (a combination of) many sources. To look up a file “my-file” along a path “. : /dir”, Kpathsea checks each element of the path in turn: first ./my-file, then /dir/my-file, returning the first match (or possibly all matches).

In order to adapt optimally to all operating systems' conventions, on non-Unix systems Kpathsea can use filename separators different from “colon” (“:”) and “slash” (“/”).

To check a particular path element *p*, Kpathsea first checks if a prebuilt database (see “Filename database” on page 18) applies to *p*, i.e., if the database is in a directory that is a prefix of *p*. If so, the path specification is matched against the contents of the database.

If the database does not exist, or does not apply to this path element, or contains no matches, the filesystem is searched (if this was not forbidden by a specification starting with “!!” and if the file being searched for must exist). Kpathsea constructs the list of directories that correspond to this path element, and then checks in each for the file being sought.

The “file must exist” condition comes into play with “.vf” files and input files read by T_EX's `\openin` command. Such files may not exist (e.g., `cmr10.vf`), and so it would be wrong to search the disk for them. Therefore, if you fail to update `ls-R` when you install a new “.vf” file, it will never be found. Each path element is checked in turn: first the database, then the disk. If a match is found, the search stops and the result is returned.

Although the simplest and most common path element is a directory name, Kpathsea supports additional features in search paths: layered default values, environment variable names, config file values, users' home directories, and recursive subdirectory searching. Thus, we say that Kpathsea *expands* a path element, meaning it transforms all the specifications into basic directory name or names. This is described in the following sections in the same order as it takes place.

Note that if the filename being searched for is absolute or explicitly relative, i.e., starts with “/” or “. /” or “. . /”, Kpathsea simply checks if that file exists.

6.1.1 Path sources

A search path can come from many sources. In the order in which Kpathsea uses them:

1. A user-set environment variable, for instance, `TEXINPUTS`. Environment variables with a period and a program name appended override; e.g., if “`latex`” is the name of the program being run, then `TEXINPUTS.latex` will override `TEXINPUTS`.
2. A program-specific configuration file, for example, a line “`S /a: /b`” in `dvips's config.ps`.
3. A Kpathsea configuration file `texmf.cnf`, containing a line like “`TEXINPUTS=/c: /d`” (see below).
4. The compile-time default.

You can see each of these values for a given search path by using the debugging options (see “Debugging actions” on page 23).

6.1.2 Config files

Kpathsea reads *runtime configuration files* named `texmf.cnf` for search path and other definitions. The search path used to look for these files is named `TEXMFCNF` (by default such a file lives in the `texmf/web2c` subdirectory). All `texmf.cnf` files in the search path will be read and definitions in earlier files override those in later files. Thus, with a search path of `.: $TEXMF`, values from `./texmf.cnf` override those from `$TEXMF/texmf.cnf`.

While reading the description of the format of the file `texmf.cnf` below, please also refer to appendix A, starting on page 31, which lists the `texmf.cnf` file on the CD-ROM.

- Comments start with “`%`” and continue to the end of the line.
- Blank lines are ignored.
- A `\` at the end of a line acts as a continuation character, i.e., the next line is appended. Whitespace at the beginning of continuation lines is not ignored.
- Each remaining line has the form:

variable [*. proname*] [=] *value*

where the “`=`” and surrounding whitespace are optional.

- The “*variable*” name may contain any character other than whitespace, “`=`”, or “`.`”, but sticking to “`A-Za-z_`” is safest.

- If “. *progname*” is present, the definition only applies if the program that is running is named *progname* or *progname.exe*. This allows different flavors of T_EX to have different search paths, for example.
- “*value*” may contain any characters except “%” and “@”. The “*\$var.prog*” feature is not available on the right-hand side; instead, you must use an additional variable. A “;” in “*value*” is translated to “:” if running under Unix; this is useful to be able to have a single `texmf.cnf` for Unix, MSDOS and Windows systems.
- All definitions are read before anything is expanded, so variables can be referenced before they are defined.

A configuration file fragment illustrating most of these points is shown below:

```

TEXMF          = {$TEXMFLOCAL;!!$TEXMFMAIN}
TEXINPUTS.latex = .;$TEXMF/tex/{latex;generic;}//
TEXINPUTS.fontinst = .;$TEXMF/tex//;$TEXMF/fonts/afm//
% e-TeX related files
TEXINPUTS.elatex = .;$TEXMF/{etex;tex}/{latex;generic;}//
TEXINPUTS.etex = .;$TEXMF/{etex;tex}/{eplain;plain;generic;}//

```

6.1.3 Path expansion

Kpathsea recognizes certain special characters and constructions in search paths, similar to those available in Unix shells. As a general example, the complex path, `~$USER/{foo,bar}//baz`, expands to all subdirectories under directories `foo` and `bar` in `$USER`'s home directory that contain a directory or file `baz`. These expansions are explained in the sections below.

6.1.4 Default expansion

If the highest-priority search path (see “Path sources” on page 15) contains an *extra colon* (i.e., leading, trailing, or doubled), Kpathsea inserts at that point the next-highest-priority search path that is defined. If that inserted path has an extra colon, the same happens with the next highest. For example, given an environment variable setting

```
>> setenv TEXINPUTS /home/karl:
```

and a `TEXINPUTS` value from `texmf.cnf` of

```
.: $TEXMF//tex
```

then the final value used for searching will be:

```
/home/karl : . : $TEXMF//tex
```

Since it would be useless to insert the default value in more than one place, Kpathsea changes only one extra “:” and leaves any others in place: it checks first for a leading “:”, then a trailing “:”, then a doubled “:”.

6.1.5 Brace expansion

A useful feature is brace expansion, which means that, for instance, $v\{a, b\}w$ expands to $vaw: vbw$. Nesting is allowed. This can be used to implement multiple \TeX hierarchies, by assigning a brace list to $\$TEXMF$. For example, in `texmf.cnf`, you find (line 52) the following definition:

```
TEXMF = {$TEXMFLOCAL, !!$TEXMFMAIN}
```

Using this you can then write something like

```
TEXINPUTS = .; $TEXMF/tex//
```

which means that, after looking in the current directory, first the full $\$TEXMFLOCAL/tex$ directory tree (on disk) and then the $!!\$TEXMFMAIN/tex$ tree (using the data base file *ls-R only*) will be searched. It is a convenient way for running two parallel \TeX structures, one “frozen” (on a CD-ROM, for instance) and the other being continuously updated with new versions as they become available. By using the $\$TEXMF$ variable in all definitions, one is sure to always search the up-to-date tree first.

6.1.6 Subdirectory expansion

Two or more consecutive slashes in a path element following a directory d is replaced by all subdirectories of d : first those subdirectories directly under d , then the subsubdirectories under those, and so on. At each level, the order in which the directories are searched is *unspecified*.

If you specify any filename components after the “//”, only subdirectories with matching components are included. For example, “/a//b” expands into directories /a/1/b, /a/2/b, /a/1/1/b, and so on, but not /a/b/c or /a/1.

Multiple “//” constructs in a path are possible, but “//” at the beginning of a path is ignored.

6.1.7 List of special characters and their meaning: a summary

The following list summarises the meaning of special characters in Kpathsea configuration files.

- : Separator in path specification; at the beginning or the end of a path it substitutes the default path expansion.
- ; Separator on non-Unix systems (acts like :).
- \$ Variable expansion.
- ~ Represents the user’s home directory.
- {. . . } Brace expansion, e.g., $a\{1, 2\}b$ will become $a1b: a2b$.
- // Subdirectory expansion (can occur anywhere in a path, except at its beginning).
- % Start of comment.
- \ Continuation character (allows multi-line entries).
- !! Search *only* database to locate file, *do not* search the disk.

6.2 Filename databases

Kpathsea goes to some lengths to minimize disk accesses for searches. Nevertheless, at installations with enough directories, searching each possible directory for a given file can take an excessively long time (this is especially true if many hundreds of font directories have to be traversed.) Therefore, Kpathsea can use an externally-built “database” file named `ls-R` that maps files to directories, thus avoiding the need to exhaustively search the disk.

A second database file `aliases` allows you to give additional names to the files listed in `ls-R`. This can be helpful to adapt to DOS-like “8.3” filename conventions in source files.

6.2.1 The filename database

As explained above, the name of the main filename database must be `ls-R`. You can put one at the root of each \TeX hierarchy in your installation that you wish to be searched (`$TEXMF` by default); most sites have only one hierarchy. Kpathsea looks for `ls-R` files along the `TEXMFDBS` path.

The recommended way to create and maintain “`ls-R`” is to run the `mktexlsr` script included with the distribution. It is invoked by the various “`mktex`”... scripts. In principle, this script just runs the command

```
cd /your/texmf/root && ls -LAR ./ >ls-R
```

presuming your system’s `ls` produces the right output format (GNU’s `ls` is all right). To ensure that the database is always up to date, it is easiest to rebuild it regularly via `CRON`, so that for changes in the installed files—perhaps after installing or updating a \LaTeX package—the file `ls-R` is automatically updated.

If a file is not found in the database, by default Kpathsea goes ahead and searches the disk. If a particular path element begins with “`!`”, however, *only* the database will be searched for that element, never the disk.

6.2.2 `kpsewhich`: Standalone path searching

The `kpsewhich` program exercises path searching independent of any particular application. This can be useful as a sort of `find` program to locate files in \TeX hierarchies (this is used heavily in the distributed “`mktex`”... scripts).

```
>> kpsewhich option... filename...
```

The options specified in “*option*” can start with either “`-`” or “`-`”, and any unambiguous abbreviation is accepted.

Kpathsea looks up each non-option argument on the command line as a filename, and returns the first file found. There is no option to return all the files with a particular name (you can run the Unix “`find`” utility for that).

The more important options are described next.

`-dpi=num` Set the resolution to “*num*”; this only affects “`gf`” and “`pk`” lookups. “`-D`” is a synonym, for compatibility with `dvips`. Default is 600.

-format=name

Set the format for lookup to “*name*”. By default, the format is guessed from the filename. For formats which do not have an associated unambiguous suffix, such as MetaPost support files and dvips configuration files, you have to specify the name as found in the first column of Table 1, which lists currently recognized names, a description, associated environment variables¹, and possible file extensions.

Table 1: Kpathsea file types

<i>Name</i>	<i>Description</i>	<i>Variables</i>	<i>Suffixes</i>
afm	Adobe font metrics	AFMFONTS	.afm
base	Metafont memory dump	MFBASES, TEXMFINI	.base
bi b	BIB \TeX bibliography source	BIBINPUTS, TEXBIB	.bi b
bst	BIB \TeX style files	BSTINPUTS	.bst
cnf	Runtime configuration files	TEXMFCNF	.cnf
dvi ps confi g	dvips configuration files, e.g., confi g. ps and psfonts. map	TEXCONFIG	.map
fmt	\TeX memory dump	TEXFORMATS, TEXMFINI	.fmt, .efmt, .efm
gf	generic font bitmap	FONTS, GFFONTS, GLYPHFONTS, TEXFONTS	.gf
graphi c/fi gure	Encapsulated PostScript figures	TEXPICTS, TEXINPUTS	.eps, .epsi
i st	makeindex style files	TEXINDEXSTYLE, INDEXSTYLE	.i st
l s-R	Filename databases	TEXMFDDBS	
map	Fontmaps	TEXFONTMAPS	.map
mem	MetaPost memory dump	MPMEMS, TEXMFINI	.mem
mf	Metafont source	MFINPUTS	.mf
mfpool	Metafont program strings	MFPOOL, TEXMFINI	.pool
mft	MFT style file	MFTINPUTS	.mft
mp	MetaPost source	MPIINPUTS	.mp
mppool	MetaPost program strings	MPPOOL, TEXMFINI	.pool
MetaPost support	MetaPost support files, used by DMP	MPSUPPORT	
ocp	Ω compiled process files	OCPIINPUTS	.ocp
ofm	Ω font metrics	OFMFONTS, TEXFONTS	.ofm, .tfm
opl	Ω property lists	OPLFONTS, TEXFONTS	.opl
otp	Ω translation process files	OTPIINPUTS	.otp
ovf	Ω virtual fonts	OVFFONTS, TEXFONTS	.ovf
ovp	Ω virtual property lists	OVPFONTS, TEXFONTS	.ovp
pk	packed bitmap fonts	<i>program</i> FONTS (<i>program</i> being XDVI, etc.), PKFONTS, TEXPKS, GLYPHFONTS, TEXFONTS	.pk
PostScri pt header	downloadable PostScript	TEXPSHEADERS, PSHEADERS	.pro, .enc
tex	\TeX source	TEXINPUTS	.tex, .cls, .sty, .clo, .def

¹ You can find definitions for these environment variables in the file texmf.cnf (page 31)

Kpathsea file types *continued*

<i>Name</i>	<i>Description</i>	<i>Variables</i>	<i>Suffixes</i>
TeX system documentation	Documentation files for the T _E X system	TEXDOCS	
TeX system sources	Source files for the T _E X system	TEXSOURCES	
texpool	T _E X program strings	TEXPOOL, TEXMFINI	.pool
tfm	T _E X font metrics	TFMFonts, TEXFonts	.tfm
Troff fonts	Troff fonts, used by DMP	TRFonts	
truetype fonts	TrueType outline fonts	TTFFonts	.ttf, .ttc
type1 fonts	Type 1 PostScript outline fonts	T1Fonts, T1INPUTS, TEXPSHEADERS, DVI PSHEADERS	.pfa, .pfb
type42 fonts	Type 42 PostScript outline fonts	T42Fonts	
vf	virtual fonts	VFFFonts, TEXFonts	.vf
web2c files	Web2c support files	WEB2C	
other text files	text files used by 'foo'	F001INPUTS	
other binary files	binary files used by 'foo'	F001INPUTS	

The last two entries in Table 1 are special cases, where the paths and environment variables depend on the name of the program: the variable name is constructed by converting the program name to upper case, and then appending INPUTS.

The environment variables are set by default in the configuration file `texmf.cnf`. It is only when you want to override one or more of the values specified in that file that you might want to set them explicitly in your execution environment.

Note that the “-format” and “-path” options are mutually exclusive.

`-mode=string`

Set the mode name to “*string*”; this only affects “gf” and “pk” lookups. No default: any mode will be found.

`-must-exist`

Do everything possible to find the files, notably including searching the disk. By default, only the `ls-R` database is checked, in the interest of efficiency.

`-path=string`

Search along the path “*string*” (colon-separated as usual), instead of guessing the search path from the filename. “//” and all the usual expansions are supported. The options “-path” and “-format” are mutually exclusive.

`-programe=name`

Set the program name to “*name*”. This can affect the search paths via the “*programe*” feature in configuration files. The default is “`kpsewhi ch`”.

- show-path=name
shows the path used for file lookups of file type “*name*”. Either a filename extension (“.pk”, “.vf”, etc.) or a name can be used, just as with “-format” option.
- debug=num
sets the debugging options to “*num*”.

6.2.3 Examples of use

Let us now have a look at Kpathsea in action.

```
>> kpsewhi ch article.cls
    /usr/local/texmf/tex/latex/base/article.cls
```

We are looking for the file `article.cls`. Since the “.cls” suffix is unambiguous we do not need to specify that we want to look for a file of type “tex” (T_EX source file directories). We find it in the subdirectory `tex/latex/base` below the “TEXMF” root directory. Similarly, all of the following are found without problems thanks to their unambiguous suffix.

```
>> kpsewhi ch array.sty
    /usr/local/texmf/tex/latex/tools/array.sty
>> kpsewhi ch latin1.def
    /usr/local/texmf/tex/latex/base/latin1.def
>> kpsewhi ch size10.clo
    /usr/local/texmf/tex/latex/base/size10.clo
>> kpsewhi ch small2e.tex
    /usr/local/texmf/tex/latex/base/small2e.tex
>> kpsewhi ch tugboat.bib
    /usr/local/texmf/bibtex/bib/beebe/tugboat.bib
```

The latter is a B_IB_T_EX bibliography database for *TUGBoat* articles.

```
>> kpsewhi ch cmr10.pk
```

Font bitmap glyph files of type .pk are used by display programs like `dvips` and `xdvi`. Nothing is returned in this case since there are no pre-generated Computer Modern “.pk” files on our system (since we use the Type1 versions on the CD-ROM).

```
>> kpsewhi ch ecrm1000.pk
    /usr/local/texmf/fonts/pk/ljfour/jknappen/ec/ecrm1000.600pk
```

For the extended Computer Modern files we had to generate “.pk” files, and since the default META-FONT mode on our installation is `ljfour` with a base resolution of 600 dpi (dots per inch), this instantiation is returned.

```
>> kpsewhi ch -dpi=300 ecrm1000.pk
```

In this case, when specifying that we are interested in a resolution of 300dpi (-dpi =300) we see that no such font is available on the system. In fact, a program like dvips or xdvi would go off and actually build the .pk files at the required resolution using the script mktexpk.

Next we turn our attention to dvips's header and configuration files. We first look at one of the commonly used files, the general prolog tex.pro for T_EX support, before turning our attention to the generic configuration file (confi g. ps) and the PostScript font map psfonts.map. As the “.ps” suffix is ambiguous we have to specify explicitly which type we are considering (“dvi ps confi g”) for the file confi g. ps.

```
>> kpsewhi ch tex.pro  
/usr/local/texmf/dvi ps/base/tex.pro  
>> kpsewhi ch --format="dvi ps confi g" confi g. ps  
/usr/local/texmf/confi g/confi g. ps  
>> kpsewhi ch psfonts.map  
/usr/local/texmf/dvi ps/base/psfonts.map
```

We now take a closer look at the URW Times PostScript support files. The name for these in Berry's font naming scheme is “utm”. The first file we look at is the configuration file, which contains the name of the map file:

```
>> kpsewhi ch --format="dvi ps confi g" confi g. utm  
/usr/local/texmf/dvi ps/psnfss/confi g. utm
```

The contents of that file is

```
p +utm.map
```

which points to the file utm.map, which we want to locate next.

```
>> kpsewhi ch --format="dvi ps confi g" utm.map  
/usr/local/texmf/dvi ps/psnfss/utm.map
```

This map file defines the file names of the Type1 PostScript fonts in the URW collection. its contents looks like (we only show part of the lines):

```
utmb8r Ni mbusRomNo9L-Medi ... <utmb8a.pfb  
utmbi8r Ni mbusRomNo9L-Medi Ital ... <utmbi8a.pfb  
utmr8r Ni mbusRomNo9L-Regu ... <utmr8a.pfb  
utmri8r Ni mbusRomNo9L-Regul tal ... <utmri8a.pfb  
utmbo8r Ni mbusRomNo9L-Medi " ... <utmb8a.pfb  
utmro8r Ni mbusRomNo9L-Regu " ... <utmr8a.pfb
```

Let us, for instance, take the Times Regular instance utmr8a.pfb and find its position in the texmf directory tree by using a search for Type1 font files:

```
>> kpsewhi ch utmr8a.pfb  
/usr/local/texmf/fonts/type1/urw/utm/utmr8a.pfb
```

It should be evident from these few examples how you can easily locate the whereabouts of a given file. This is especially important if you suspect that the wrong version of a file is picked up somehow, since kpsewhich will show you the first file encountered.

6.2.4 Debugging actions

Sometimes it is necessary to investigate how a program resolves file references. To make this feasible in a convenient way Kpathsea offers various debug levels:

- 1 stat calls (file tests). When running with an up-to-date l s-R database this should almost give no output.
- 2 References to hash tables (like l s-R database, map files, configuration files).
- 4 File open and close operations.
- 8 General path information for file types searched by Kpathsea. This is useful to find out where a particular path for the file was defined.
- 16 Directory list for each path element (only relevant for searches on disk).
- 32 File searches.

A value of -1 will set all the above options; in practice you will probably always use these levels if you need any debugging.

Similarly, with the dvips program, by setting a combination of debug switches, one can follow in detail where files are being picked up from. Alternatively, when a file is not found, the debug trace shows in which directories the program looks for the given file, so that one can get an indication what the problem is.

Generally speaking, as most programs call the Kpathsea library internally, one can select a debug option by using the KPATHSEA_DEBUG environment variable, and setting it to (a combination of) values as described in the above list.

Let us consider, as an example, a small L^AT_EX source file, hello-world.tex, which contains the following input.

```
\documentclass{article}
\begin{document}
Hello World!
\end{document}
```

This little file only uses the font cmr10, so let us look how dvips prepares the PostScript file (we want to use the Type1 version of the Computer Modern fonts, hence the option -Pcms).

```
>> dvips -d4100 hello-world -Pcms -o
```

In this case we have combined dvips's debug class 4 (font paths) with Kpathsea's path element expansion (see dvips Reference Manual, texpdf/doc/html/dvips/dvips_toc.html). We get something like the following (we have rearranged the output for easier display):

```
debug: start search(file=texmf.cnf, must_exist=1, find_all=1,
  path=.: /usr/local/bin/texlive: /usr/local/bin:
  /usr/local/bin/texmf/web2c: /usr/local:
  /usr/local/texmf/web2c: /.: /teTeX/TeX/texmf/web2c: ).
kdebug: start search(file=l s-R, must_exist=1, find_all=1,
  path=~ /tex: /usr/local/texmf).
```

```

kdebug: search(ls-R) => /usr/local/texmf/ls-R
kdebug: start search(file=aliases, must_exist=1, find_all=1,
  path=~/.tex:/usr/local/texmf)
kdebug: search(aliases) => /usr/local/texmf/aliases
kdebug: start search(file=config.ps, must_exist=0, find_all=0,
  path=~/.tex:!!/usr/local/texmf/dvips//)
kdebug: search(config.ps) => /usr/local/texmf/dvips/config/config.ps
kdebug: start search(file=/root/.dvi.psrc, must_exist=0, find_all=0,
  path=~/.tex:!!/usr/local/texmf/dvips//)
search(file=/home/goossens/.dvi.psrc, must_exist=1, find_all=0,
  path=~/.tex/dvips://!!/usr/local/texmf/dvips//)
kdebug: search($HOME/.dvi.psrc) =>
kdebug: start search(file=config.cms, must_exist=0, find_all=0,
  path=~/.tex/dvips://!!/usr/local/texmf/dvips//)
kdebug: search(config.cms)
=>/usr/local/texmf/dvips/cms/config.cms

```

dvips starts by locating its working files. First, texmf.cnf is found, which gives the definitions of the search paths for the other files, then the file database ls-R (to optimize file searching) and the file aliases, which makes it possible to declare several names (e.g., a short DOS-like “8.3” and a more natural longer version) for the same file. Then dvips goes on to find the generic configuration file config.ps before looking for the customization file .dvi.psrc (which, in this case is *not found*). Finally, dvips locates the config file for the Computer Modern PostScript fonts config.cms (this was initiated with the -Pcms option on the dvips command). This file contains the list of the “map” files which define the relation between the T_EX, PostScript and file system names of the fonts.

```

>> more /usr/local/texmf/dvips/cms/config.cms
  p +ams.map
  p +cms.map
  p +cmbkm.map
  p +amsbkm.map

```

dvips thus goes on to find all these files, plus the generic map file psfonts.map, which is always loaded (it contains declarations for commonly used PostScript fonts; see the last part of Section 6.2.3 for more details about PostScript map file handling).

At this point dvips identifies itself to the user:

```
This is dvips 5.76a Copyright 1997 Radical Eye Software (www.radical-eye.com)
```

then goes on to look for the prolog file texc.pro,

```

kdebug: start search(file=texc.pro, must_exist=0, find_all=0,
  path=~/.tex/dvips://!!/usr/local/texmf/dvips//:
  ~/.tex/fonts/type1//!!/usr/local/texmf/fonts/type1//)
kdebug: search(texc.pro) => /usr/local/texmf/dvips/base/texc.pro

```

After having found the file in question, dvips outputs date and time, and informs us that it will generate the file hello-world.ps, then that it needs the font file cmr10, and that the latter is declared as “resident”:

```

TeX output 1998.02.26:1204' -> hello-world.ps
Defining font () cmr10 at 10.0pt
Font cmr10 <CMR10> is resident.

```

Now the search is on for the file `cmr10.tfm`, which is found, then a few more prolog files (not shown) are referenced, and finally the Type1 instance `cmr10.pfb` of the font is located and included in the output file (see last line).

```
kdebug: start search(file=cmr10.tfm, must_exist=1, find_all=0,
  path=.:~/tex/fonts/tfm/!!/usr/local/texmf/fonts/tfm/!:
  /var/tex/fonts/tfm/).

<cmr10.pfb>[1]
```

6.3 Runtime options

Another of the nice features of Web2c 7.2 is its possibility to control a number of memory parameters (in particular, array sizes) via the runtime file `texmf.cnf` read by `Kpathsea`. The listing of `texmf.cnf` is shown in Appendix A, starting on page 31; the settings of all parameters can be found in Part 3 of that file. The more important control variables are (line numbers refer to the file `texmf.cnf`):

`main_memory` Total words of memory available, for `TEX`, `METAFONT` and `MetaPost`. You must make a new format file for each different setting. For instance, you could generate a “huge” version of `TEX`, and call the format file `hugetex.fmt`. Using the standard way of specifying the program name used by `Kpathsea`, the particular value of the `main_memory` variable will then be read from `texmf.cnf` (see line 327 for the generic value and line 329 for the “huge” one instantiated by `hugetex`, etc.).

`extra_mem_bot` Extra space for “large” `TEX` data structures: boxes, glue, breakpoints, etc. Especially useful if you use `PlCTEX` (line 300).

`font_mem_size` Number of words for font information available for `TEX`. This is more or less the total size of all TFM files read (lines 310–314).

`hash_extra` Additional space for the hash table of control sequence names. Approximately 10,000 control sequences can be stored in the main hash table; if you have a large book with numerous cross-references, this might not be enough. On lines 319 to 321 you see that both the `hugetex` and `pdftex` program invocations ask for an extra 10,000 control sequences (the default value of `hash_extra` is zero, as seen on line 296).

Of course, this facility is no substitute for truly dynamic arrays and memory allocation, but since this is extremely difficult to implement in present `TEX`, these runtime parameters provide a practical compromise allowing some flexibility.

7 Other T_EX systems on the CD-ROM

While the main portion of **T_EX Live** (the fonts, macros and documentation) can be used on any T_EX system, the set of runnable binaries is not suitable for everyone. To make the disk as widely useful as possible, we have included the original distributions of six complete T_EX systems: two for Macintosh (OzT_EX and CMacT_EX), one for Windows 95 (MikT_EX), one for DOS and OS/2 (emT_EX), and two for DOS or Windows (dj gpp or wi ngut),

7.1 DJGPP T_EX

This is a DJGPP port by Eli Zaretskii (eliz@is.elta.co.il) of T_EX, Web2c 7.2, DVI drivers, and related utilities. The programs are the same versions as, and behave in an identical way to, the other Web2c 7.2-based systems, for Unix, Amiga and Win32, on this CD-ROM. In the next release of **T_EX Live**, we hope to have them runnable directly from the CD-ROM.

The package is supplied as a compressed .zip archive, which is intended to be unpacked to one of your disk drives. This should minimize potential problems due to how long file names are stored on the CD-ROM and supported by various CD drivers on different operating systems.

7.1.1 Installation

Create a directory for the T_EX packages and change your current working directory to be it. For example:

```
mkdir c:\texlive
cd c:\texlive
c:
```

In the following description, we assume that the root of your T_EX installation is c:\texlive. However, there's nothing magic in that name; you can use any other name you wish. (In particular, those who have other DJGPP ports installed would probably want to use the root of their DJGPP installation tree as the place to install T_EX.)

Now insert the **T_EX Live** CD-ROM into your drive, wait until the LED on the drive goes off, unzip the package. For your convenience, we provide a free program for that purpose: InfoZip's UnZip; it is in the same directory where the compressed archive is held. We recommend using that unzip.exe since it will automatically support long file names on Windows 9X, where the compressed programs support them as well.

Assuming your CD-ROM drive letter is F:, type the following from the DOS prompt (if you are doing this on Windows, open a DOS box and type from there):

```
f:\systems\msdos\djgpp\unzip f:\systems\msdos\djgpp\djgpptex.zip
```

If you want to use any other unzip program, be sure to invoke it with an option that causes it to preserve directory hierarchy as recorded in the zip file (e.g., for PKUNZIP, use the -d switch). Also, be sure to use a program that supports long file names if you intend to use T_EX programs on Windows 9X.

Finally, add the directory c:\texlive\bin to your PATH, and define variables for reading documentation:

```
set INFOPATH=c:/texlive/info;%INFOPATH%
set MANPATH=c:/texlive/man;%MANPATH%
```

(the forward slashes are important in these variables!)

That's all! You are now ready to run the programs. Some additional details can be found in [systems/msdos/dj gpp/README. dj gpp](#)

7.2 OzTeX²

OzTeX is a Macintosh TeX system created by Andrew Trevorrow. The OzTeX application includes TeX, L^ATeX, a DVI previewer, a DVI-to-PostScript translator (Tom Rokicki's dvips) and a driver for QuickDraw printers. OzTeX also includes dvidvi, dvicopy, and Angus Duggan's PostScript utilities: psbook, psnup, psselect and pstops.

The version of dvips included in OzTeX supports HyperTeX and the partial downloading of PostScript fonts. It has also been enhanced for Mac users in a number of ways: Standard Mac PostScript fonts (LWFN files) can be downloaded, fully or partially; all OzTeX-specific `\special` commands are supported, such as the inclusion of PICT/PNTG/EPSP files; the dvips output can be sent directly to the current printer.

OzTeX's previewer has lots of features to make it easy to proofread DVI files. It can handle PK and PostScript fonts. Anti-aliasing is supported. Virtual fonts are processed on the fly. The previewer supports most of the `\special` commands generated by L^ATeX's `color`, `graphics` and `hyperref` packages. It recognizes all dvips-specific `\special`s and those it cannot handle (like rotation) are silently ignored.

OzTeX includes all the most popular formats and macro packages: Plain TeX, L^ATeX, AMS-TeX, AMS-L^ATeX and REVTeX are all installed and ready to run.

OzTeX is easy to extend and customize. A default configuration file is read when OzTeX starts up; it contains a host of parameters for setting up search paths, telling TeX how much memory to allocate for various arrays, specifying which TFMs are for PostScript fonts, etc. A Config menu makes it easy to load other config files at any time. And for even more flexibility, OzTeX can automatically load a specified config file just before typesetting, previewing or printing.

7.2.1 Additional programs

The usual assortment of TeX-related programs are provided with OzTeX, including OzMF, a Mac implementation of METAFONT, and OzMP, a Mac port of John Hobby's MetaPost program for producing PostScript pictures using a METAFONT-like language.

The following programs are also distributed with OzTeX, courtesy of their authors; BibTeX by Vince Darley; MakeIndex by Rick Zaccone; Excalibur, a TeX/L^ATeX spelling checker, by Rick Zaccone and Robert Gottshall; and AlphaLite, a TeX/L^ATeX-savvy text editor, by Pete Keleher.

7.3 CMacTeX³

CMacTeX is an implementation of T_EX for the Macintosh by Thomas Kiffe (tom@tkiffe.com). It includes the three main parts of any T_EX installation—T_EX, METAFONT and dvips. It also includes two DVI previewers, a utility for printing DVI files on a non PostScript printer, a PostScript previewer and numerous utilities for manipulating T_EX fonts. Full support for the automatic generation of pk font files is an integral part of the distribution. CMacTeX can be configured to work in an integrated fashion with BBEdit, Alpha, and MPW. It will run on any Macintosh with 8 MB of RAM and System 7.

CMacTeX is shareware. The registration fee is US\$35 for a single-user license and US\$150 for a site license.

Installation instructions can be found in the file [systems/macintosh/cmactex/ReadMeFirst](#)

7.4 MiKTeX⁴

MiKTeX 1.10 is an implementation by Christian Schenk (cschenk@berlin.snafu.de) of T_EX- and METAFONT-related utilities for Windows NT and Windows 95. The MiKTeX distribution includes T_EX; L^AT_EX 2_ε (December '97) including standard packages; METAFONT; MetaPost; dvips MakeIndex; BIBT_EX; YAP (Yet Another Previewer); TeXware (dvitype etc.); METAFONTware (gftopk, etc.); psutils (psselect, pstops etc.); and DVIconv.

Installation instructions can be found in the file [systems/win32/miktex/README.TXT](#)

7.5 emTeX

The emTeX distribution for DOS and OS/2 is written by Eberhard Mattes (mattes@azu.informatik.uni-stuttgart.de). It includes the T_EX typesetter, the METAFONT font generation program, printer drivers, screen previewers, and tools like BIBT_EX and MakeIndex. It also includes the macro packages L^AT_EX 2.09 and L^AT_EX 2_ε. Fonts are included as pixel files and METAFONT source files.

Installation instructions can be found in the file [systems/msdos/emtex/README.ENG](#).

8 History and acknowledgements

This CD-ROM distribution is a joint effort by the T_EX Users Group, the UK T_EX Users Group, the French T_EX Users (GUTenberg), and the German T_EX Users (DANTE e.V.), with the support of the Czech/Slovak, Dutch, Indian and Polish user groups. Discussion began in late 1993 when the Dutch T_EX Users Group was starting work on its 4AllT_EX CD-ROM for MS-DOS users, and it was hoped at that time to issue a single, rational, CD-ROM for all systems. This was far too ambitious a target, but it did spawn not only the very successful 4AllT_EX CD-ROM, but also the TUG Technical Council working group on a *T_EX Directory Structure*, which specified how to create consistent and manageable collections of T_EX support files. The final draft of the TDS was published in the December 1995 issue of *TUGboat*, and it was clear from an early stage that one desirable product would be a model structure on CD-ROM. The CD-ROM you now have is a very direct result of the working group's deliberations. It was also clear that the success of the 4AllT_EX CD-ROM showed that Unix users would benefit from a similarly easy system, and this is the other main strand of **T_EX Live**.

³ This section is taken from the CMacTeX documentation.

⁴ This section is drawn from the documentation.

We undertook to make a new Unix-based TDS CD-ROM in the autumn of 1995, and quickly identified Thomas Esser's teTeX as the ideal setup, as it already had multi-platform support and was built with portability across file systems in mind. Thomas agreed to help, and work began seriously at the start of 1996. The first edition was released in May 1996. At the start of 1997, Karl Berry completed a major new release of his Web2c package, which included nearly all the features which Thomas Esser had added in teTeX , and we decided to base the 2nd edition of the CD-ROM on the standard Web2c , with the addition of teTeX 's `texconfi g` script. The 3rd edition of the CD-ROM was based on a major revision of Web2c , 7.2, by Olaf Weber; at the same time, a new revision of teTeX was being made, and **T\TeX Live** shares almost all of its features.

We are particularly grateful to:

- Karl Berry, who gave advice, encouragement, and (of course) provided the original Web2c distribution;
- Mimi Burbank, who arranged access at the Florida State University Supercomputer Research Institute to a slew of different computers to compile T\TeX on, and acted as an essential guinea-pig whenever asked;
- Kaja Christiansen, who provided essential feedback and documentation assistance;
- Thomas Esser, without whose marvellous teTeX package this CD-ROM would certainly not exist, and whose continual help makes it a better product;
- Robin Fairbairns, who edited this Guide for *Baskerville* and *TUGboat*;
- Eitan Gurari, whose TeX4ht was used to create the HTML version of this documentation, and who worked tirelessly to improve it at short notice;
- Thorsten Schmidt, for the Windows installation program, at very short notice;
- Olaf Weber, for his patient assembly and maintenance of Web2c 7.2;
- Graham Williams, on whose work the catalogue of packages depends.

Libor Skarvada, Staszek Wawrykiewicz, Erik Frambach, and Ulrik Vieth kindly translated documentation into their respective languages, checked other documentation, and provided very welcome feedback.

And special thanks to Fabrice Popineau (Win32), Eli Zaretskii (DJGPP), and Andreas Scherer (Amiga), who ported and compiled entire Web2c -based T\TeX systems, and worked their socks off to get versions ready for this CD-ROM.

9 Future versions

This CD-ROM is not a perfect product! We plan to re-issue it once a year, and would like to provide more help material, more utilities, more installation programs, and (of course) an ever-improved and checked tree of macros and fonts. This work is all done by hard-pressed volunteers in their limited spare time, and a great deal remains to be done. If you can help, don't hesitate to put your name forward!

Corrections, suggestions and additions for future revisions should be sent to:

Sebastian Rahtz
7 Stratfield Road
Oxford OX2 7BG
United Kingdom
s.rahtz@elsevier.co.uk

Updates, notes, and suggestions will be made available on CTAN in `info/texlive`. A WWW page for information and ordering details is at <http://www.tug.org/tex-live.html>.

A The texmf.cnf file

```
1 % Public domain.
2 %
3 % What follows is a super-summary of what this .cnf file can
4 % contain. Please read the Kpathsea manual for more information.
5 %
6 % texmf.cnf is generated from texmf.cnf.in, by replacing @var@ with the
7 % value of the Make variable 'var', via a sed file texmf.sed, generated
8 % (once) by kpathsea/Makefile (itself generated from kpathsea/Makefile.in
9 % by configure).
10 %
11 % Any identifier (sticking to A-Za-z_ for names is safest) can be assigned.
12 % The '=' (and surrounding spaces) is optional.
13 % No % or @ in texmf.cnf.in, for the sake of autogeneration.
14 % (However, %'s and @'s can be edited into texmf.cnf or put in envvar values.)
15 % $foo (or ${foo}) in a value expands to the envvar or cnf value of foo.
16 %
17 % Earlier entries (in the same or another file) override later ones, and
18 % an environment variable foo overrides any texmf.cnf definition of foo.
19 %
20 % All definitions are read before anything is expanded, so you can use
21 % variables before they are defined.
22 %
23 % If a variable assignment is qualified with '.PROGRAM', it is ignored
24 % unless the current executable (last filename component of argv[0]) is
25 % named PROGRAM. This foo.PROGRAM construct is not recognized on the
26 % right-hand side. For environment variables, use FOO_PROGRAM.
27 %
28 % Which file formats use which paths for searches is described in the
29 % various programs' and the kpathsea documentation.
30 %
31 % // means to search subdirectories (recursively).
32 % A leading !! means to look only in the ls-R db, never on the disk.
33 % A leading/trailing/doubled ; in the paths will be expanded into the
34 % compile-time default. Probably not what you want.
35
36 % Part 1; Search paths and directories.
37
38 % You may wish to use one of the $SELFAUTO... variables here so TeX will
39 % find where to look dynamically. See the manual and the definition
40 % below of TEXMFCNF.
41 %
42 % User texmf trees can be catered for like this...
43 % HOMETEXMF = $HOME/texmf
44
45 % Now, list all the texmf trees. If you have multiple trees,
46 % use shell brace notation, like this:
47 % TEXMF = {$HOMETEXMF;!!$TEXMFLOCAL;!!$TEXMFMAIN}
48
```

```

49 TEXMFMAIN = $SELFAUTOPARENT/texmf
50 TEXMFLOCAL=/usr/TeX.local
51 TEXMF = {$TEXMFLOCAL;!!$TEXMFMAIN}
52
53 % The system trees. These are the trees that are shared by all the users.
54 SYSTEXMF = $TEXMF
55
56 % Where generated fonts may be written. This tree is used when the sources
57 % were found in a system tree and either that tree wasn't writable, or the
58 % varfonts feature was enabled in MT_FEATURES in mktex.cnf.
59 VARTEXFONTS = /var/tmp/fonts
60
61 % Where to look for ls-R files. There need not be an ls-R in the
62 % directories in this path, but if there is one, Kpathsea will use it.
63 TEXMFDDBS = $TEXMF;$VARTEXFONTS
64
65 % It may be convenient to define TEXMF like this:
66 % TEXMF = {$HOMETEXMF:!!$TEXMFLOCAL:!!$TEXMFMAIN:$HOME}
67 % which allows users to set up entire texmf trees, and tells TeX to
68 % look in places like ~/tex and ~/bibtex. If you do this, define TEXMFDDBS
69 % like this:
70 % TEXMFDDBS = $HOMETEXMF:$TEXMFLOCAL:$TEXMFMAIN:$VARTEXFONTS
71 % or mktexlsr will generate an ls-R file for $HOME when called, which is
72 % rarely desirable. If you do this you'll want to define SYSTEXMF like
73 % this:
74 % SYSTEXMF = $TEXMFLOCAL:$TEXMFMAIN
75 % so that fonts from a user's tree won't escape into the global trees.
76 %
77 % On some systems, there will be a third system tree which contains all
78 % the font files that may be created as well as the formats. For
79 % example
80 % VARTEXMF = /var/lib/texmf
81 % is used on many Linux systems. In this case, set VARTEXFONTS like this
82 % VARTEXFONTS = $VARTEXMF/fonts
83 % and do not mention it in TEXMFDDBS (but _do_ mention VARTEXMF).
84
85 %%%
86 % Usually you will not need to edit any of the other variables in part 1. %
87 %%%
88
89 % WEB2C is for Web2C specific files. The current directory may not be
90 % a good place to look for them.
91 WEB2C = $TEXMF/web2c
92
93 % TEXINPUTS is for TeX input files -- i.e., anything to be found by \input
94 % or \openin, including .sty, .eps, etc.
95
96 % LaTeX 2e specific macros are stored in latex.
97 % latex209 is not supported, at the request of the authors of LaTeX
98 TEXINPUTS.latex = .;$TEXMF/tex/{latex;generic;}//

```

423 max_print_line = 79

```

B Catalogue of Packages

Table 2: \TeX Live packages

<i>Package</i>	<i>Collection</i>	<i>Description</i>
<code>\2up</code>	generic3/2up	Allows one to print a document two-up, with considerable flexibility as to paper size and layout. It produces a standard dvi file, and does not involve an additional dvi or PostScript filter. It should work with most \TeX macro packages
<code>a0poster</code>	latex3	A \LaTeX class providing fonts in sizes of 12pt up to 107pt. It also makes sure that in math formulas the symbols appear in the right size. This package also creates a postscript header file for dvips which ensures that the poster will be printed in the right size. Sizes DIN A0, DIN A1, DIN A2 and DIN A3 are also supported.
<code>a4</code>	latex3	Originally for \LaTeX 2.09 but updated for \LaTeX 2 ϵ . Mostly superseded by native \LaTeX 2 ϵ support for a4 paper but defines the extra option of widemargins. The <code>geometry</code> package is usually what you are looking for though.
<code>aaai</code>	latex3	AAAI style.
<code>accents</code>	latex3	A package for multiple accents with nice features concerning creation of accents and placement of scripts.
<code>achemso</code>	latex3	\LaTeX and \BIBTeX style for American Chemical Society
<code>acronym</code>	latex3	This package ensures that all acronyms used in the text are spelled out in full at least once. It also provides an environment to build a list of acronyms.
<code>adfathesis</code>	latex3	A class that satisfies the requirements of the Australian Defence Force Academy (a college of the University of New South Wales).
<code>adrlist</code>	latex3	Using address lists in \LaTeX .
<code>ae</code>	fonts3	A set of virtual fonts which emulates T1 coded fonts using the standard CM fonts. The package is called AE fonts (for Almost European). The main use of the package is to produce PDF files using Type1 versions of the CM fonts instead of the bitmapped EC fonts.
<code>aguplus</code>	latex3	Styles for American Geophysical Union.
<code>aiaa</code>	latex3	A bundle of \LaTeX / \BIBTeX files and sample documents to aid those producing papers and journal articles according to the guidelines of the American Institute of Aeronautics and Astronautics (AIAA)
<code>alatex</code>	formats3	An extended \LaTeX with better modularity
<code>alg</code>	latex3	\LaTeX environments for typesetting algorithms
<code>algorithms</code>	latex3	Defines a floating algorithm environment designed to work with the <code>algorithmic</code> package.
<code>alpha-osf3.2</code>	systems1	System binaries for Alpha running OSF 3.2.
<code>alpha-osf4.0</code>	systems1	System binaries for Alpha running OSF 4.0.
<code>altfont</code>	latex3	A generalised replacement for some parts of psnfss and mfnfss. Similar to <code>psfont</code> with the PostScript specific code removed.
<code>amiga</code>	systems1	An Amiga port of the complete UNIX- \TeX system.

Catalogue of Packages *continued*

<i>Package</i>	<i>Collection</i>	<i>Description</i>
amsfonts	ams2	A set of miscellaneous T _E X fonts from the American Mathematical Society that augment the standard set normally distributed with T _E X. The set includes: Extra mathematical symbols; Blackboard bold letters (uppercase only); Fraktur letters; Subscript sizes of bold math italic and bold Greek letters; Subscript sizes of large symbols such as sum and product; Added sizes of the Computer Modern small caps font; Cyrillic fonts (from the University of Washington); Euler math fonts.
amslatex	ams2	A collection of loosely related files that are distributed together by the American Mathematical Society. These files are miscellaneous enhancements to L ^A T _E X whose aim is superior information structure of mathematical documents and superior printed output.
amstex	ams2	American Mathematical Society plain T _E X macros
answers	latex3	Styles for setting questions (or exercises) and answers.
antyktor	fonts3	Antykwa Toruńska is a serif font designed by the Polish typographer Zygfryd Gardzielewski. Reconstructed and digitized as Type1 by J. M. Nowacki.
apa	latex3	L ^A T _E X class and B _I B _T E _X style used to format text according to the American Psychological Association Publication Manual (4th ed.) specifications for manuscripts or, with an option to the package, in an APA journal style format or as a regular document.
apl	fonts3	Fonts for typesetting APL programs.
arabtex	lang3	Macros and fonts for typesetting Arabic
asaetr	latex3	An attempt to mimic Transactions of the ASAE.
ascii	fonts3	Support for IBM extended ASCII font.
astro	fonts3	Astronomical (planetary) symbols.
aurora	dvips3	Header files for dvips to make colour separations
authorindex	latex3	A package to generate a list of all authors cited in a document along with a list of pages where these citations occur.
autotab	latex3	Generating tabular setups.
babel	latex1	Multilingual support for L ^A T _E X.
babelfmts	formats2	Extra L ^A T _E X format files with different default hyphenation patterns
backgammon	fonts3	Style for typesetting backgammon boards.
bakoma	fonts2	Computer Modern and AMS fonts in PostScript Type1 form.
barcode2	fonts3	??
barcodes	fonts3	Fonts for making barcodes.
barr	graphics3	Diagram macros by Michael Barr.
base	latex1	Basic L ^A T _E X system.
bayer	fonts3	An implementation of the universal font by Herbert Bayer of the bauhaus school for METAFONT. It is supported in L ^A T _E X with a package and font definition file.
bbding	fonts3	An NFSS-interface to the symbol font bbding containing many of the Zapf dingbats fonts.
bbm	fonts3	Blackboard variant fonts for Computer Modern, with L ^A T _E X support
bbtbase	bibtex1	Basic B _I B _T E _X support files
bbtdoc	bibtex2	Basic B _I B _T E _X documentation
beebe	bibtex2	Nelson Beebe's collection of T _E X-related bibliographies, and B _I B _T E _X style files

Catalogue of Packages *continued*

<i>Package</i>	<i>Collection</i>	<i>Description</i>
beton	latex3	Typeset a L ^A T _E X 2 _ε document with the Concrete fonts designed by Don Knuth and used in his book “Concrete Mathematics”.
bibarts	bibtex3	A package to assist in making bibliographical lists as are common in the arts. Includes a german manual with some commentary in the tex file in english.
biblist	latex3	BIB _T E _X styles by Joachim Schrod.
blue	formats3	Kees van der Laan’s BLUe format, a concise but expressive document preparation system modelled on Knuth’s manmac
booktabs	latex2	Nicer layout of tables
borceux	graphics3	Diagram macros by Francois Borceux
bosisio	latex3	A collection of packages including: dblfont ; graphfig ; mathcmd ; mathenv ; quotes ; sobolev
bridge	latex3	Macros for typesetting Bridge diagrams.
c-pascal	plain3	A T _E X macro package for typesetting programs in C and Pascal. Program sources in C and Pascal can also be input.
calendar	latex3	A package for calendars and timetables. Includes, for example, a package which organizes date items in a format suitable for conference schedules, itineraries, academic teaching timetables and the like.
calrsfs	latex3	Nicer calligraphic letters.
camel	latex3	Comprehensive bibliography manager (prototype citation engine for L ^A T _E X3). Will become BIB _T E _X 1.0 on release. Under development.
caption	latex2	Extends caption capabilities for figures and tables, such as the caption width, style, font. Many aspects are tunable as options.
carlisle	latex2	Miscellaneous small packages by David Carlisle
catalog	doc2	Graham Williams Catalogue of T _E X packages
cbgreek	fonts3	METAFONT source files for a complete set of Greek fonts.
cc-pl	fonts3/cc-pl	The Polish version of Computer Concrete fonts
ccfonts	latex	L ^A T _E X font definition files for the Concrete fonts and a L ^A T _E X package for typesetting documents using Concrete as the default font family. The files support OT1, T1, TS1, and Concrete math incl. AMS fonts (Ulrik Vieth’s concmath).
cchess	fonts3	Macros and fonts for typesetting Chinese Chess board diagrams.
cd-cover	latex3	A package for typesetting CD covers.
cellular	plain3	Cellular table construction
changebar	latex2	Generate changebars in L ^A T _E X documents.
chemcono	latex3	A L ^A T _E X style file for using compound numbers in chemistry documents. It works like \cite and the \thebibliography, using \fcite and \theffblibliography instead. It allows compound names in documents to be numbered and does not affect the normal citation routines.
chemsym	latex3	Macros for typing chemical symbols
cheq	fonts3	Adobe chess font.
cherokee	fonts3	Fonts for Cherokee scripts
chess	fonts3	Fonts for typesetting chess boards.
china2e	latex3	A L ^A T _E X package to produce Chinese calendar symbols of the old Chinese lunisolar calendar.

Catalogue of Packages *continued*

<i>Package</i>	<i>Collection</i>	<i>Description</i>
circ	graphics3	Macros for typesetting circuit diagrams. Several electrical symbols like resistor, capacitor, transistors etc., are defined. The symbols can be connected with wires.
circuit	graphics3	A set of macros for drawing electric circuits containing fundamental elements, amplifiers, transistors, and basic logic gates to include in T _E X, L ^A T _E X, or similar documents.
cirth	fonts3	Fonts for Cirth
cite	latex2	Supports compressed, sorted lists of numerical citations: [8,11–16].
cm	fonts1	Computer Modern fonts
cmbright	fonts2	A family of sans serif fonts for T _E X and L ^A T _E X, based on Donald Knuth's CM fonts. It comprises OT1, T1 and TS1 encoded text fonts of various shapes as well as all the fonts necessary for mathematical typesetting, incl. AMS symbols. This collection provides all the necessary files for using the fonts with L ^A T _E X.
cmcyralt	latex3	Alternative Russian encoding support
cmextra	fonts2	Extra Computer Modern fonts, from the American Mathematical Society
cmpica	fonts3	A Computer Modern Pica variant
cmpk	fonts3	Computer Modern fonts in PK format
cms	fonts2	
cmsd	latex3	A package including additional fd files. Its purpose is to provide an alternative interface to the CM Sans Serif boldface fonts. The EC (T1, Cork) encoded versions of the 'CM Sans Serif boldface extended' fonts differ considerably from the traditionally (OT1) encoded ones: At large sizes, > 10pt, they have thinner strokes and are much wider. At 25pt they are hardly to be recognized as being 'boldface'. This package attempts to make these T1 fonts look like the traditional ones did. You do not need any new fonts; the package just changes the way LaTeX makes use of the current ones.
codepage	latex3	Support for variant code pages.
colorsep	dvips3	Support for colour separation when using dvips
colortab	plain3	Lets you shade or color the cells in the alignment environments such as \halign and L ^A T _E X's tabular and array environments.
concmath	fonts3	Concrete math fonts derived from Computer Modern math fonts using parameters from Concrete text fonts. A L ^A T _E X package providing the necessary font definition code is included.
concrete	fonts3	A wrapper to load up the appropriate packages to use the concrete fonts.
context	generic3	A full featured, parameter driven macro package, which fully supports advanced interactive documents. ppchtex is a module that can be used to typeset chemical formulas.
count1to	latex3	A L ^A T _E X package which sets count1 to count9, which can be used to select certain pages with a driver. Also provides access to the number of pages of the document. Uses the everyshi package.
croatian	lang3	Fonts for typesetting Croatian scripts
crossword	latex3	Macros for typesetting crossword puzzles.
crosswr	latex3	??
csfonts	fonts2	Czech/Slovak-tuned METAFONT Computer Modern fonts.
cslatex	latex	L ^A T _E X support for Czech/Slovak typesetting.
csplain	plain2	Plain T _E X support for Czech/Slovak typesetting.

Catalogue of Packages *continued*

<i>Package</i>	<i>Collection</i>	<i>Description</i>
curves	graphics3	Draws curves in the L ^A T _E X picture environment using parabolas between points with continuous slope at points. Equivalent to technical pens with compasses and French curves.
custom-bib	latex2	Package generating customized BIB _T E _X bibliography styles from a generic file using docstrip.
cyrillic	lang2/cyrillic	General support for L ^A T _E X typesetting in Cyrillic (fonts, hyphenation patterns, Babel package etc)
dancers	fonts3	Font for the Sherlock Holmes ‘Dancing Men’
dates	latex3	Macros for parsing date strings.
deleq	latex3	Provides a more flexible numbering of equations, subequations, and ‘recycled’ equations, including ‘partial’ equation numbers (‘3a’, ‘3b’ etc.).
devanagari	lang3	Fonts for typesetting Devanagari
dialogl	latex3	Macros for constructing interactive L ^A T _E X scripts
dinbrief	latex3	German letter DIN style.
directory	bibtex3	A package for L ^A T _E X and BIB _T E _X that facilitates the construction, maintenance and exploitation of an address book like database.
dotseqn	latex3	Flush left equations with dotted letters to the numbers
draftcopy	latex3	Places the word DRAFT (or other words) in light grey diagonally across the background (or at the bottom) of each (or selected) pages of the document.
dratex	graphics3	General drawing macros entirely in T _E X
dropping	latex3	A L ^A T _E X 2 _ε macro for dropping the first character(s) (or word(s)) of a paragraph. This is an extension of the L ^A T _E X 2.09 package dropcaps . This package automatically takes care of finding the font name.
dtk	latex3	Macros for the DANTE publication.
duerer	fonts3	Computer Duerer fonts.
dvips	generic1	Tom Rokicki’s dvi to PostScript driver
dvipsbas	dvips1	Basic support files for dvips
ean	generic3	Font for making EAN barcodes.
easy	latex3	Macros for simplifying the writing of equations.
ec	fonts2	The ec fonts support the complete L ^A T _E X T1 encoding, as defined at the 1990 TUG conference hold at Cork/Ireland. They are intended to be as stable as the cm fonts are, i.e., there shall be no more changes to the tfm files. The ec fonts also contain a Text Companion Symbol font, called tc, featuring many useful characters needed in typesetting, for example oldstyle digits, currency symbols (including the newly created Euro symbol), the permille sign, copyright, trade mark and servicemark as well as a copyleft sign, and many others. Recent releases of L ^A T _E X 2 _ε support the ec fonts. The dc fonts, which were termed as preliminary versions, will disappear from the archives.
ecc	fonts3	The METAFONT sources and tfm files of the European Concrete Fonts. This is the EC implementation of Knuth’s Concrete fonts, including also the corresponding text companion fonts.
edmac	plain3	A macro package for typesetting scholarly critical editions

Catalogue of Packages *continued*

<i>Package</i>	<i>Collection</i>	<i>Description</i>
eepic	graphics2	A set of T _E X macros for L ^A T _E X implementing several extensions to EPIC and the L ^A T _E X picture drawing environment, including the drawing of lines at any slope, the drawing of circles in any radii, and the drawing of dotted and dashed lines much faster with much less T _E X memory, and providing several new commands for drawing ellipses, arcs, splines, and filled circles and ellipses.
eiad	latex3	Macros and EIAD fonts.
elsevier	latex3	Preprint style for Elsevier Science journals
elvish	fonts3	Font for typesetting Tolkien Elvish script
emp	latex3	A package for encapsulated MetaPost pictures in L ^A T _E X. Useful for keeping illustrations in sync with the text. It also frees the user from inventing descriptive names for PostScript files that fit into the confines of file system conventions.
endfloat	latex3	Place all figures on pages by themselves at the end of the document with markers like “[Figure 3 about here]” appearing in the text (by default) near to where the figure (or table) would normally have occurred.
engwar	fonts3	Font for typesetting Tolkien Engwar script, by Michael Urban
envbig	latex3	Printing addresses on envelopes
envlab	latex3	A L ^A T _E X 2 _ε package for producing mailing envelopes and labels, including barcodes and address formatting according to the US Postal Service rules. Redefines the standard <code>\make-label</code> command of the L ^A T _E X 2 _ε letter documentclass.
eplain	formats2	Simple but powerful extended version of the plain format, adding support for bibliographies, tables of contents, enumerated lists, verbatim input of files, numbered equations, tables, two-column output, footnotes and commutative diagrams.
eqname	latex3	Style for different equation numbering.
eqnarray	latex3	More generalised equation arrays with numbering.
esieecv	latex3	Curriculum vitæ for French.
euler	latex3	Provides a setup for using the AMS Euler family of fonts for math in L ^A T _E X documents. “The underlying philosophy of Zapf’s Euler design was to capture the flavor of mathematics as it might be written by a mathematician with excellent handwriting.” [concrete-tug] The euler package is based on Knuth’s macros for the book “Concrete Mathematics”. The text fonts for the Concrete book are provided by the beton package.
everyssel	latex3	L ^A T _E X package which provides hooks into <code>\selectfont</code> .
everyshi	latex3	Hooks for taking action at every <code>\shipout</code>
exam	latex3	Package for typesetting exam scripts.
examdesign	latex3	Package for typesetting exams.
exams	latex3	Exam questions can be multiple choice or free form long/short answer questions. Options include the typesetting of the exam itself, an exam showing all the answers and a collection of questions and answers. Questions can be parametrized. Use of a random generator provides for automatic shuffling of multiple choice items.
expdlist	latex3	Expanded description environments

Catalogue of Packages *continued*

<i>Package</i>	<i>Collection</i>	<i>Description</i>
export	latex3	This package allows the user to export/import the values of L ^A T _E X registers (counters, rigid and rubber lengths only). It is definitely NOT for faint-hearted users.
fancybox	latex2	Provides variants of \fbox: \shadowbox, \doublebox, \ovalbox, \ovalbox, with helpful tools for using box macros and flexible verbatim macros. You can box mathematics, floats, center, flushleft, and flushright, lists, and pages.
fancyhdr	latex3	Support for sophisticated control of page headers and footers in L ^A T _E X 2 _ε . It supersedes the older fancyheadings package which should no longer be used.
fancyvrb	latex2	Sophisticated handling of verbatim text, to write it out, read it in, and typeset it
fax	latex3	Document class for preparing faxes.
fc	fonts3	Fonts for African languages, complementary to Computer Modern.
feynmf	graphics3	Macros and fonts for creating Feynman (and other) diagrams.
float	latex2	Improves the interface for defining floating objects such as figures and tables. Introduces the boxed float and the ruled float. You can define your own floats and improve the behaviour of the old ones. Also incorporates the H option of the superseded here package. You can select this as automatic default with \floatplacement{figure}{H}.
floatfig	latex3	Allows text to be wrapped around figures.
floatflt	latex3	Float text around figures and tables which do not span the full width of a page. This is an improved version of floatfig. It is more or less similar to floatingtable. The tables/figures can be set left/right or alternating on even/odd pages. Works with the multicol package. Doesn't work well in the neighbourhood of list environments unless you change your L ^A T _E X document.
fncychap	latex3	This package provides six predefined chapter headings. Each can be modified using a set of simple commands. Optionally one can modify the formatting routines in order to create additional chapter headings. This package was previously known as FancyChapter.
foihhtml	latex3	Provides integration between FoilTeX and LaTeX2HTML . It adds sectioning commands and elements of logical formatting to FoilTeX and provides support for FoilTeX commands in LaTeX2HTML. It also supports automatic creation of LaTeX2HTML images with proper font sizes and shapes when converting FoilTeX documents.
foiltex	latex3	A L ^A T _E X 2 _ε class for overhead transparencies. Can be used with fancybox to place a variety of borders around the slides.
fontinst	latex3	T _E X macros for converting Adobe Font Metric files to T _E X metric and virtual font format
fontname	texlive1	Karl Berry's scheme for naming fonts in T _E X
fonts	latex1	Extra line and circle fonts for L ^A T _E X
footbib	latex3	A package to put bibliographic references as footnotes.
footmisc	latex3	Sophisticated footnotes package for L ^A T _E X capturing as package options much (if not all) of the functionality of the various other footnote packages.
footnpag	latex3	Allows footnotes on individual pages to be numbered from 1, rather than being numbered sequentially through the document.

Catalogue of Packages *continued*

<i>Package</i>	<i>Collection</i>	<i>Description</i>
formats	texlive2	Prebuilt T _E X format and METAFONT base files
fp	latex3	Provides an extensive collection of arithmetic operations for fixed point real numbers of high precision.
french	lang2	Style for French typography
fribrief	latex3	A L ^A T _E X class for writing letters.
fundus	latex3	Providing L ^A T _E X access to various font families.
futhark	fonts3	Fonts for the Older Futhark script
g-brief	latex3	A document class for L ^A T _E X 2 _ε . Serves for formatting formless letters in german or english language.
gb4e	latex3	Government Binding styles.
general	doc1	Useful general documentation.
genmisc	generic3	Miscellaneous small files for all formats, specific to the T_EX Live CD-ROM.
geometry	latex3	A package which allows L ^A T _E X 2 _ε users to customise page layout (page sizes) using an easy and flexible user interface. For example <code>\geometry{body={6.5in,8.75in}, top=1.2in, left=2cm, no-head}</code> . This is an update of the now superseded pagesize package.
geomsty	latex3	Provides: inclusion of PostScript figures, and of TeX text within figures; automatic creation of index entries and cross-references where appropriate; no need to worry about fragile commands in almost all situations; greater versatility in defining theorem-like environments; proofing aids such as version numbers and a running index.
german	latex2	Style for German typography.
germbib	bibtex2	German variants of standard BIB _T E _X styles.
go	fonts3	Fonts and macros for typesetting go games.
gothic	fonts3	Gothic and ornamental initial fonts by Yannis Haralambous.
graphics	latex2	The primary L ^A T _E X package for the support of the inclusion of graphics generally produced with other tools. This package aims to give a consistent interface to including the file types that are understood by your printer driver. For documentation see grfguide .
grnumalt	latex3	A package which implements a numbering system used in ancient Athens, producing the ‘Athenian’ numeral for any positive arabic numeral. The package can be used as a means to provide alternative counters.
guides	doc2	Guides to using L ^A T _E X, in English, German, French and Greek
gustlib	plain3/gustlib	Various small utility packages for typesetting in plain T _E X, with a Polish perspective
hands	fonts3	Pointing hand fonts
harpoon	latex3	Extra harpoons, using the graphics package
harvard	bibtex2	The Harvard bibliography style family.
harvmac	plain3	Paul Ginsparg’s Harvard macros for scientific articles
hh	latex3	Fancy boxing effects
histogr	latex3	Drawing histograms with the L ^A T _E X picture environment.
hppa1.1-hpux10.10	systems1	System binaries HP running hpux10.10.
html	doc2	Various T _E X documentation converted to HTML
hyper	latex3	Redefines L ^A T _E X cross-referencing commands to insert <code>\special</code> commands for HyperTeX dvi viewers, such as recent versions of xdvi.

Catalogue of Packages *continued*

<i>Package</i>	<i>Collection</i>	<i>Description</i>
hyperref	latex3	Redefines L ^A T _E X cross-referencing commands to insert \special commands for HyperTeX dvi viewers, or for translation to Adobe's PDF (Portable Document Format) for viewing on the Web with Acroread.
hyphen	lang1	Collection of hyphenation patterns.
i386-linux	systems1	System binaries for Intel machines running Linux.
ieeepes	latex3	Allows typesetting of transactions, as well as discussions and closures, for the IEEE Power Engineering Society Transactions journals.
ifacmtg	latex3	Elsevier Science preprint style for IFAC meetings.
imac	latex3	A set of files for producing correctly formatted documents for the International Modal Analysis Conference.
indxcite	latex3	A package to automatically generate an Author Index based on citations made using BIB _T E _X . It requires the use of the harvard and index packages and L ^A T _E X 2 _ε .
info	doc2	Documentation in GNU info form
ini	texlive1	Startup files for building formats
inputenc	latex3	Controlling input encoding
insbox	generic3	A T _E X macro for inserting pictures/boxes into paragraphs.
ipa	latex3	Style for using International Phonetic Alphabet fonts
isostds	latex3	Class and package files for typesetting ISO International Standard documents. Several standard documents have been printed by ISO from camera-ready copy prepared using L ^A T _E X and these files. One set of files is for generic ISO typesetting and the other is an extension set of packages for typesetting ISO 10303 standards.
jadetex	latex3	Macro package on top of L ^A T _E X to typeset T _E X output of Jade DSSSL implementation.
jknappen	latex2	Miscellaneous macros, mostly for making use of extra fonts, by Jörg Knappen.
jsmisc	plain3	Miscellaneous useful macros by Joachim Schrod.
jura	latex3	A document class for German law students.
kdgreek	fonts3	Greek fonts.
kluwer	latex3	A L ^A T _E X 2 _ε class file for submissions of journal articles to Kluwer Academic Publishers Dordrecht, the Netherlands.
knuth	doc3	Knuth's own documentation, including the T _E Xbook and the META-FONTbook
koma-script	latex3	A drop-in replacement for the article/report/book classes with emphasis on European rules of typography and paper formats as laid down by Jan Tschichold. The article class, for example, becomes scrartcl.
kuvio	graphics3	Drawing macros and fonts for diagrams.
labels	latex3	Support for printing sheets of sticky labels (but could also be used for business cards). The number of rows and columns of labels, and their size, can be changed.
lamstex	formats3	A merge of the best in AMST _E X and L ^A T _E X
lastpage	latex3	Reference the number of pages in your L ^A T _E X document (as in a page footer that says: Page N of M).
latex2html	doc3	A Perl program that translates L ^A T _E X source files into HTML (HyperText Markup Language). For each source file given as an argument the translator will create a directory containing the corresponding HTML files.

Catalogue of Packages *continued*

<i>Package</i>	<i>Collection</i>	<i>Description</i>
leftidx	latex3	This package enables left subscripts and superscripts in math mode. These subscripts and superscripts are automatically raised for better fitting to the symbol they belong to.
lettrine	latex3	A package to typeset dropped capitals in various ways, typically those described in the French typographic books.
levy	latex3	Macros for using Silvio Levy's Greek fonts
lgc	doc3	Examples from the <i>L^AT_EX Graphics Companion</i>
lgreek	latex3	Macros for using Silvio Levy's Greek fonts
lineno	latex3	Adds line numbers to selected paragraphs with reference possible through the L ^A T _E X <code>\ref</code> and <code>\pageref</code> cross reference mechanism. Version 2.00 supports numbering of one in five lines and switching the line numbers from the left to the right side of the page in twoside mode.
linguex	latex3	A package to facilitate the formatting of linguist examples. Automatically takes care of example numbering, indentations, indexed brackets, and the "*" in grammaticality judgments. <code>linguho.sty</code> allows for automatic extraction of a handout from a file generated with <code>linguex.sty</code> .
listings	latex3	A package for typesetting listings using L ^A T _E X 2 _ε . The source code is read directly by T _E X. Keywords, comments and strings can be typeset using different styles, e.g., default is bold for keywords, italic for comments and no special style for strings.
localloc	latex3	Macros for localizing T _E X register allocations
logic	fonts3	METAFONT font for drawing logic diagrams.
lollipop	formats3	A new generation format
tablex	latex3	Modifies the <code>tabularx</code> environment to combine the features of the <code>tabularx</code> package (auto-sized columns in a fixed width table) with those of the <code>longtable</code> package (multi-page tables).
ltxdoc	latex1	Class for documented L ^A T _E X 2 _ε classes.
ltxmisc	latex2	Miscellaneous L ^A T _E X styles.
lw35ps	fonts2	Font metrics and L ^A T _E X font description files for standard 35 PostScript fonts.
ly1	latex3	Support for LY1 L ^A T _E X encoding, i.e. the Y&Y <code>texnansi</code> encoding.
mailing	latex3	Macros for mail merging
makeindex	texlive1	A general purpose hierarchical index generator; it accepts one or more input files (often produced by a text formatter such as T _E X or <code>troff</code>), sorts the entries, and produces an output file which can be formatted. The formats of the input and output files are specified in a style file; by default, input is assumed to be a <code>idx</code> file, as generated by L ^A T _E X.
malayalam	lang3	Fonts for typesetting Malayalam, with a pre-processor
malvern	fonts3	A new sans-serif font family
mapcodes	latex3	Support for multiple character sets and encodings.
maple	latex3	Styles and examples for the MAPLE newsletter.
margbib	latex3	A package for displaying bibliography tags in the margins.
mathcomp	latex2	A package which provides access to some interesting characters of the Text Companion fonts (TS1 encoding) in math mode.

Catalogue of Packages *continued*

<i>Package</i>	<i>Collection</i>	<i>Description</i>
mathematica	fonts3	Virtual T _E X fonts that can be used with the PostScript fonts distributed with Mathematica 3.0. The archives use a TDS conforming directory structure. A style file for L ^A T _E X 2 _ε is included, that enables use of the fonts and the new symbols from L ^A T _E X 2 _ε .
mcite	latex3	Support for collapsing multiple citations into one, as customary in physics journals
mdwtools	latex3	Miscellaneous tools by Mark Wooding, including support for @, a doafter command, footnotes, mathenv for various alignment in maths, list handling, trivial maths oddments, rewrite of L ^A T _E X's tabular and array environments, verbatim handling, and syntax diagrams.
metasupp	texlive1	MetaPost support files
mex	formats2	MeX is an adaptation of Plain TeX and LaTeX209 formats to the Polish language and to the Polish printing customs. It contains a complete set of METAFONT sources of Polish fonts, hyphenation rules for the Polish language and sources of formats.
mff	latex3	A package to provide something similar to 'multiple master' fonts, but using METAFONT; you specify a font by a set of METAFONT parameters, and T _E X makes up a mf file to generate the required font; this package is not integrated with NFSS (or MakeTeXTFM) yet fun.
mflogo	latex1	L ^A T _E X package and font definition file to access the Knuthian 'logo' fonts described in 'The METAFONTbook' and the METAFONT and MetaPost logos in L ^A T _E X documents.
mfmisc	fonts1	Small support files for METAFONT.
mfnfss	latex3	Font description files for extra fonts like yinit and ygoth
mfpic	graphics3	Macros which generate METAFONT code for drawing pictures.
mft	texlive1	
mftoeps	fonts3	Converts MF to EPS.
midnight	generic3	A set of useful macro tools
minitoc	latex3	Produce a table of contents for each chapter.
mips-irix5.3	systems1	System binaries for SGI box running Irix 5.3.
mips-irix6.2	systems1	System binaries for SGI box running Irix 6.2.
misc209	latex2	Miscellaneous small macro files for L ^A T _E X 2.09.
mnras	plain3	Styles for the Monthly Notices of the Royal Astronomical Society.
monster	latex3	Towards a more rational and modular L ^A T _E X, by Matt Swift; a set of powerful tools
montex	fonts3	MonTeX provides Mongolian support for L ^A T _E X 2 _ε (now Cyrillic, but soon also Classical Mongolian).
morehelp	latex3	A package to enhance L ^A T _E X 2 _ε error messages by providing descriptions of the possible causes including those that may not be obvious. This style is effectively an online substitute for error lists found in the L ^A T _E X books, although it cannot completely replace them. Only true LaTeX errors are included, TeX errors are beyond the reach of ordinary macros.

Catalogue of Packages *continued*

<i>Package</i>	<i>Collection</i>	<i>Description</i>
moresize	latex3	A L ^A T _E X 2 _ε package for using font sizes up to 35.88pt, for example with the new EC fonts. New commands \HUGE and \ssmal l for selecting font sizes are provided together with some options working around current L ^A T _E X 2 _ε shortcomings in using big font sizes. The package also provides options for improving the typesetting of paragraphs (or headlines) with embedded math expressions at font sizes above 17.28pt.
moreverb	latex3	A verbatim mode that can handle TABs properly, can number lines, can number lines in an included file, can produce boxed verbatims, etc.
morse	fonts3	A package for printing Morse code signs.
mpbase	metapost1	Basic MetaPost support files.
mpfnmark	latex3	A package which provides the command \mpfootnotemark, which can be used in the same way as \footnotemark. The difference between these two macros is that within minipage environments the latter uses the standard footnote marker style (defined by \thefootnote), while the new command uses the minipage footnote marker style (defined by \thempfootnote).
mslapa	latex3	L ^A T _E X and BIB _T E _X style files for a respectably close approximation to APA (American Psychological Association) citation and reference style.
mtbe	plain3	Examples from <i>Mathematical T_EX by Example</i> by Arvind Borde
multenum	latex3	Multi-column enumerated lists
multi	dvips3	dvips header for making n-up pages
multido	generic2/multido	Provides a generic loop macro for use in any T _E X macro package
musictex	generic3	Typesetting music with T _E X.
musixtex	generic3	Extended MusicT _E X, with better slurs
myletter	latex3	Another letter package.
nassflow	latex3	Drawing Nassi-Schneidermann diagrams.
natbib	bibtex2	A bibliography style that handles author-year and numbered references.
newalg	latex3	Format algorithms like Cormen, Leiserson and Rivest.
newsletr	plain3	Macros for making newsletters
newthm	latex3	A modified version of the theorem-style which provides generation of lists of theorems. This has been superseded by ntheorem
niceframe	latex3	Support for fancy framing of pages
nomencl	latex3	Nomenclature package for producing lists of symbols using the capabilities of the MakeIndex program.
ntgclass	latex2	Versions of the standard L ^A T _E X article and report classes, rewritten to reflect a more European design, by the Dutch T _E X Users Group
ntheorem	latex3	A package for handling theorem-like environments. Additionally to several features for defining the layout of theorem-like environments which can be regarded to be standard requirements for a theorem-package, it provides solutions for two related problems: generation of lists of theorem-like environments. In contrast to former approaches, it provides solutions for two related problems: generation of lists of theorem-like environments (theorems, definitions, examples, and positions, even if the environment ends with a displaymath or (even nested) list environments; it also copes with the amsmath package. This is done in the same manner as the handling of labels by using the aux file. It also introduces the generation of lists of theorem-like environments in the same manner as listoffigures.

Catalogue of Packages *continued*

<i>Package</i>	<i>Collection</i>	<i>Description</i>
numline	latex3	Macros for numbering lines.
objectz	latex3	Macros for typesetting Object Z
oca	fonts3	OCR font
ocr-a	fonts3	Fonts for OCR-A
ocr-b	fonts3	Fonts for OCR-B
ogham	fonts3	Fonts for typesetting Ogham script
ogonek	latex3	Support for Polish typography and the ogonek
oldstyle	latex3	Font information needed to load the <code>cmmi</code> and <code>cmmi b</code> fonts for use to produce oldstyle numbers
osmanian	fonts3	Osmanian fonts by Alan Stanier for writing Somali
ot2cyr	fonts2	Macros to use to the OT2 Cyrillic encoding
overpic	latex3	The overpic environment is a cross between the \LaTeX picture environment and the <code>\includegraphics</code> command of <code>graphicx</code> . The resulting picture environment has the same dimensions as the included eps graphic. \LaTeX commands can be placed on the graphic at defined positions. A grid for orientation is available.
overword	latex3	This package provides two macros which can be used as building blocks for the parsing of text. For an example of their use, see the <code>calendar</code> package.
pandora	fonts3	The Pandora font family
paper	latex3	A class derived from <code>article</code> , tuned for producing papers for journals. Introduces new layout options and font commands for sections/parts. Defines a new <code>keywords</code> environment, and <code>subtitle</code> and <code>institution</code> commands for the title section. New commands for revisions. And more.
parallel	latex3	Provides a parallel environment which allows two columns of text to be typeset. Useful for typesetting two languages side-by-side.
patch	latex3	Macros for package management.
pawpict	latex3	A package for easy inclusion of graphics made by PAW (Physics Analysis Workstation). You need to have PAW installed on your system to benefit from this package.
pb-diagram	latex3	Diagram package, using LAMST \TeX fonts, by Paul Burchard.
pdcmac	plain3	Damian Cugley's macro tools.
pdftex	plain2	Macro packages for variant \TeX which writes PDF format.
phonetic	fonts3	METAFONT Phonetic fonts, based on Computer Modern
physe	formats3	PHYSE format
phyzzx	formats3	A \TeX format for physicists
picinpar	latex3	Insert pictures into paragraphs. (NOTE: Piet van Oostrum does not recommend this package. <code>Picins</code> is recommended instead.)
picins	latex3	Insert pictures into paragraphs.
pictex	graphics2	Picture drawing macros for \LaTeX .
piff	latex3	Macro tools by Mike Piff
pl	latex3	Literate Programming for Prolog with \LaTeX .
pl-mf	fonts3	Polish extension of Computer Modern fonts in MF sources.
pl-qx	fonts3/pl-qx	\LaTeX support for extra Polish fonts (Antyktor etc)
plainmisc	plain1	Miscellaneous useful macros for plain \TeX
plaintex	plain1	Basic Plain \TeX macros

Catalogue of Packages *continued*

<i>Package</i>	<i>Collection</i>	<i>Description</i>
platex	latex3	PLaTeX provides tools to typeset documents in Polish using LaTeX2e. It can use Polish fonts (so-called PL fonts), EC fonts, it can be usefull even one has only CM fonts.
plgraph	generic3	L ^A T _E X graphics package with wrapper to allow it to be used with generic plain T _E X
plpsfont	fonts3	Polish extension of Computer Modern fonts, PL fonts in PostScript T1 format. Use the same tfm files as for pk fonts generated by METAFONT.
pmgraph	latex3	A set of extensions to L ^A T _E X picture environment, including a wider range of vectors, and a lot more box frame styles.
poligraf	generic3	Page preparation for prepress, color separation, crop-marks, color and gray scale bars, booklet preparation, etc.
polish	doc3/polish	General T _E X and L ^A T _E X documentation in Polish
polyglot	latex3	A package for LaTeX2e multilingual support.
prelim2e	latex3	Allows the marking of preliminary versions of a document.
prettyref	latex3	Additional functionality to L ^A T _E X 2 _ε label-reference mechanism. It allows the author to “preformat” all types of labels.
progkeys	latex3	The file ‘programs.sty’ is intended to allow a parameterized way of typesetting programs with T _E X/L ^A T _E X commands inside. The file ‘keywords.sty’ allows use and define sets of keywords that will be typeset with different fonts, according to the wish of the user.
program	latex3	Typesetting programs and algorithms
proofs	latex3	Macros for building proof trees.
psafm	fonts3	AFM files for PostScript fonts
psfonts	fonts2	PostScript fonts for use with T _E X and L ^A T _E X.
psfrag	graphics2	A set of macros and a PostScript header which allows L ^A T _E X constructions (equations, picture environments, etc.) to be precisely superimposed over Encapsulated PostScript figures. The user can use his/her favorite drawing tool to create an EPS figure, placing simple text “tags” where each replacement is to be placed. PSfrag will automatically remove those tags from the figure and replace them with the L ^A T _E X construction that the user specifies, properly aligned, scaled, and/or rotated.
psizzl	formats3	A T _E X format from SLAC
pslatex	latex2	A small package that makes L ^A T _E X default to ‘standard’ PostScript fonts. It is basically a merger of the times and mathptm styles from the psnfss suite of packages. You must have installed standard L ^A T _E X and PSNFSS PostScript fonts to use this package. The main novel feature is that the pslatex package tries to compensate for the visual differences between the Adobe fonts by scaling Helvetica by 90%, and ‘condensing’ Courier (i.e. scaling horizontally) by 85%. The package is supplied with a (unix) shell file for a ‘pslatex’ command that allows standard L ^A T _E X documents to be processed, without needing to edit the file.
psnfss	fonts2	Font definition files, macros and font metrics for common PostScript fonts
psnfssx	latex3	Extra styles and encodings for PS fonts, including Y&Y encoding support.
pspicture	latex2	Replacement for core L ^A T _E X picture macros to use PostScript \speci al commands
pspk	fonts3	PK files for common PostScript fonts

Catalogue of Packages *continued*

<i>Package</i>	<i>Collection</i>	<i>Description</i>
pstricks	graphics2	An extensive collection of PostScript macros that is compatible with most \TeX macro packages, including Plain \TeX , \LaTeX , AMS- \TeX , and AMS- \LaTeX . Included are macros for color, graphics, pie charts, rotation, trees and overlays. It has many special features, including: a wide variety of graphics (picture drawing) macros, with a flexible interface and with color support. There are macros for coloring or shading the cells of tables.
punk	fonts3	Donald Knuth's punk font
qfonts	fonts3	Public domain Adobe Type 1 fonts; so far only Quasi-Palladio (regular, italic, bold and bold italic), based on URW's Palladio, is available; the design of Palladio, alike the design of the obsolete Platan, resembles the design of Hermann Zapf's Palatino. (PFB, AFM, PFM, TFM and ENC files for TeX-ers, DOC).
qobitree	graphics3	\LaTeX macros for typesetting trees
qsymbols	latex3	For defining systematic mnemonic abbreviations, starting with ' for math symbols and \ for arrows, from the amssymb and stmaryrd packages
quotchap	latex3	A package for creating decorative chapter headings with quotations, a PostScript output device and the <code>psnfss</code> package are needed, the <code>color</code> package and a greyscale output device are recommended.
r-und-s	latex3	This package decodes the german 'R- und S-Sätze', which are numerically coded security advice for chemical substances into plain text. This is e.g., used to compose security sheets or lab protocols and especially useful for students of chemistry.
ragged2e	latex3	\LaTeX package which defines new commands <code>\Centering</code> , <code>\RaggedLeft</code> , and <code>\RaggedRight</code> and new environments <code>Center</code> , <code>FlushLeft</code> , and <code>FlushRight</code> , which set ragged text and are easily configurable to allow hyphenation.
rsc	latex3	Use RCS (revision control system) tags in \LaTeX documents.
realcalc	plain3	Macros for real arithmetic calculations.
refcheck	latex3	Intended to check references in a document, looking for numbered but unlabelled equations, for labels, which are not used in the text, for unused bibliography references. It can also display label names in text near corresponding numbers of equations and/or bibliography references.
refman	latex3	Variant report and article styles
revtex	latex2	Styles for American Physical Society, American Institute of Physics, and Optical Society of America. Only works in compatibility mode under $\LaTeX 2\epsilon$.
rlepsz	generic3	A macro package for use with <code>epsf.tex</code> which allows PostScript labels in an <code>eps</code> file to be replaced by \TeX labels.
rmpage	latex3	A package to help change page layout parameters in \LaTeX . It lets you change page layout parameters in small steps over a range of values using options. It can set <code>\textwidth</code> appropriately for the main font, and ensure that the text fits inside the printable area of a printer. An <code>rmpage</code> -formatted document can be typeset identically without <code>rmpage</code> after a single cut and paste operation. Local configuration can set defaults: for all documents; and by class, by printer, and by paper size. The <code>geometry</code> package is better if you want to set page layout parameters to particular measurements.

Catalogue of Packages *continued*

<i>Package</i>	<i>Collection</i>	<i>Description</i>
rotating	latex2	A package built on the standard L ^A T _E X graphics package to perform all the different sorts of rotation one might like, including complete figures and tables and captions.
rotfloat	latex3	Rotate floats.
rplain	latex3	Redefines the ‘plain’ pagestyle. The page numbers are now in the lower right corner.
rs6000-aix3.2.5	systems1	System binaries for RS6000 running AIX 3.2.5.
rs6000-aix4.1.4.0	systems1	System binaries for RS6000 running AIX 4.1.4.0.
sauter	fonts3	Extensions to the CM fonts, providing a parameterization scheme to build fonts at true design sizes
scale	latex3	A package to scale a document by $\sqrt{2}$. This is useful if you are preparing a document on e.g. A5 paper and want to print on A4 paper to achieve a better resolution.
schedule	latex3	A package intended to automatically format weekly schedules using LaTeX’s picture environment. It requires the packages <code>calc</code> and <code>color</code> . Its main feature is the accuracy with which appointments are represented: boxes drawn to represent a particular appointment are accurate to the minute – i.e., a 31 minute appointment will have a box 1/60th longer than a 30 minute appointment. A number of features are included to allow the user to customize the output.
script	latex3	Variant report / book styles
semantic	latex3	Eases the typesetting of notation of semantics and compilers. Includes T-diagrams, various derivation symbols and inference threes.
seminar	latex2	Produce overhead slides (transparencies) with bells and whistles.
setspace	latex3	Provides commands and environments for doing double and one-and-a-half line spacing based on pt size. If a different spacing is required then the <code>\setstretch{basel i nestretch}</code> command is supported. The spacing environment takes one argument which is the baselinestretch to use, e.g., <code>\begin{spacing}{2.5}</code> .
shadbox	latex3	A tool to shade the background of any box – text, figure, table etc. – using Plain (La)T _E X.
shadethm	latex3	Package that allows declarations of the form <code>\newshadetheorem{thm}{Theorem}</code> or <code>\newshadetheorem{}[]{}[]</code> or <code>\newshadetheorem{}{}[]</code> to produce shaded boxes from the usual command <code>\begin{theorem} ... \end{theorem}</code> . The color package is required.
showlabels	latex3	Show label commands in the margin.
siam	generic3	Styles for SIAM publications
sidecap	latex3	Defines new L ^A T _E X environments called SCfigure and SCTable (analogous to figure and table), to typeset captions sideways. Options include outercaption, innercaption, leftcaption and rightcaption.
siggraph	latex3	Document class for formatting papers according to the specifications for submission to the annual ACM Siggraph conference
simpsons	fonts3	Metafont source for Simpsons characters
slashbox	latex3	Draw an oblique (slash) line in a ‘tabular’ column in L ^A T _E X
slidenotes	latex3	A class package for the easy production of a slide collection with annotations. Builds on the report style (or variants).

Catalogue of Packages *continued*

<i>Package</i>	<i>Collection</i>	<i>Description</i>
smallcap	latex3	Support for all 4 shapes of Small caps in DC1.3 where SC becomes a family, rather than a shape (<code>\scshape</code> is replaced by <code>\scfam i y</code>). Thus you can write <code>\bf\scfam i y\sl shape</code> to get small caps bold slanted.
songbook	latex3	Package for typesetting song lyrics.
sparc-solaris2.5.1	systems1	System binaries for Sun Sparc running Solaris 2.5.1.
sparc-solaris2.6	systems1	System binaries for Sun Sparc running Solaris 2.6.
sparc-sunos4.1.4	systems1	System binaries for Sparc running SunOS 4.1.4.
sprite	graphics3	Macros to set bitmaps with \TeX
ssquote	latex3	\LaTeX package and font definition file to access the ‘cmssq’ fonts, i.e. Computer Modern Sans Serif Quotation Style. The \LaTeX package also defines a <code>chapterquotes</code> environment as an example application.
startex	formats3	A \TeX format designed to help students write short reports and essays. It provides the user with a suitable set of commands for such a task. It is also more robust than plain \TeX and \LaTeX .
stmaryrd	fonts2	St Mary Road symbols for functional programming.
subeqn	latex3	Package for subequation numbering.
subeqnarray	latex3	Equation array with sub numbering.
subfigure	latex3	Figures divided into subfigures.
supertabular	latex3	A multi-page tables package. Generally <code>longtabl</code> is a little easier to use and more flexible.
swift	latex3	Miscellaneous macros by Matt Swift.
tabbing	latex3	A package offering a variant of the tabbing environment which allows accented letters.
tap	plain3	An advanced, however easy table package. With PostScript allows shaded/coloured tables with diagonal rules. Plain, LaTeX etc.
taylor	graphics3	Diagram macros by Paul Taylor.
tbe	plain3	Examples from Arvind Borde’s <i>TeX by Example</i>
tds	doc1	TDS (\TeX Directory Structure documentation).
tengwar	fonts3	Font for typesetting Tolkien Tengwar script, by Michael Urban
tex-ps	generic3	\TeX PostScript.
tex4ht	latex2	Provide a configurable (La) \TeX -based authoring system for hypertext.
texdraw	graphics3	Graphical macros, using embedded PostScript.
texip	formats3	Macros from <i>TeX in Practice</i>
texlive	texlive1	Basic material for TeX Live .
texsis	formats3	TeXsis is a Plain \TeX macro package which provides useful features for typesetting research papers and related documents. For example, it includes support specifically for: Automatic numbering of equations, figures, tables and references; Simplified control of type sizes, line spacing, footnotes, running headlines and footlines, and tables of contents, figures and tables; Specialized document formats for research papers, preprints and “e-prints,” conference proceedings, theses, books, referee reports, letters, and memoranda; Simplified means of constructing an index for a book or thesis; Easy to use double column formatting; Specialized environments for lists, theorems and proofs, centered or non-justified text, and listing computer code; Specialized macros for easily constructing ruled tables. TeXsis was originally developed for physicists, but others may also find it useful. It is completely compatible with Plain TeX.

Catalogue of Packages *continued*

<i>Package</i>	<i>Collection</i>	<i>Description</i>
text1	formats3	T _E X format from the University of Washington
textcomp	latex3	Supports the Text Companion fonts which provide many text symbols (such as baht, bullet, copyright, musicalnote, onequarter, section, and yen) in the TS1 encoding.
textfit	latex3	Package to support fitting of text to a given width or height by scaling the font
textmerg	latex3	Merge text in T _E X and L ^A T _E X. Useful, for example, in mail merge.
thesis	latex3	A class for producing a thesis based on the report class for a more European and more flexible look. Supports options like noindent, noitemization, headline, nocenter, crosshair, and chapterbib.
thumb	latex3	A package for making running thumb marks in documents.
timesht	latex3	Package for typesetting time sheets.
timing	latex3	Fonts and macro package for drawing timing diagrams.
tipa	fonts3	Fonts and macros for IPA phonetics characters.
titlesec	latex3	A package providing a friendly interface to sectioning commands. You can select among various title styles or change the font of all headings with a single command. It provides simple one-step page styles, too.
tools	latex2	Standard L ^A T _E X 2 _ε tools, for extended tabular, verbatim and theorem support
tracking	latex3	Automatically adjust spaces between symbols in words or phrases to fit them into a specified length. Any chain of symbols (including spaces) in the current font may be treated.
treesvr	latex3	Tree macros.
treetex	plain3	Allows the automatic layout of n-ary trees with arbitrary node sizes in L ^A T _E X, using an external C program to do much of the hard work.
tug	doc3	T _E X Users Group information
tugboat	generic2	L ^A T _E X macros for TUGboat articles.
type1	fonts2	Public domain PostScript Type1 fonts, including the URW fonts distributed with Ghostscript
type1cm	latex3	A package that removes the restriction when using scalable versions of the cm fonts (Type1 Bakoma, or versions from BSR/Y&Y, or True Type versions from Kinch, PCTeX etc.) where L ^A T _E X restricts the cm fonts to discrete sizes.
typehtml	latex3	Typeset HTML (i.e., World Wide Web documents) directly from L ^A T _E X. Can handle almost all of HTML2, and most of the math fragment of the draft HTML3.
uaclasses	latex3	This package provides a L ^A T _E X 2 _ε document class named ‘ua-thesis’ for typesetting theses and dissertations in the official format required by the University of Arizona. Moreover, there is a fully compatible alternative document class ‘my-thesis’ for private “nice” copies of the dissertation, and the respective title pages are available as separate packages to work with “any” document class.
ucthesis	latex3	A modified version of the standard L ^A T _E X REPORT style that is accepted for use with University of California PhD dissertations and Masters theses.
ulsy	latex3	Extra mathematical characters
umlaute	latex3	An interface to inputenc for using alternate input encodings
umrand	fonts3	Package for page frames.

Catalogue of Packages *continued*

<i>Package</i>	<i>Collection</i>	<i>Description</i>
underlin	latex3	Package for underlining. Be advised that underlining is considered bad style in typesetting. See also ulem which is a specific package for L ^A T _E X.
useful	doc2	Useful documentation; various L ^A T _E X guides, FAQ, fontname docs, etc.
utthesis	latex3	University of Toronto thesis style.
uwthesis	latex3	University of Washington thesis
vdm	latex3	Typesetting VDM schemas
vector	latex3	Macros for more convenient representation of vectors in L ^A T _E X 2 _ε , both symbolically and as implicit or explicit rows/columns of elements
vertex	plain3	Styles for economics working papers and journals
vita	latex3	This class provides necessary macros to prepare your Curriculum Vitae or Resume.
vrbl	latex3	Verbatim macros via plain T _E X
vrslon	latex3	Defines a command which produces a version number in the dvi-file when L ^A T _E X is run.
wasy	fonts3	The wasy fonts (Waldis symbol fonts)
wasysym	latex2	Makes some additional characters available that come from the wasy fonts (Waldis symbol fonts). These fonts are not automatically included in NFSS2/L ^A T _E X 2 _ε since they take up important space and aren't necessary if one makes use of the packages amsfonts or amssymb. Symbols include: join, box, diamond, leadsto, sqsubset, lhd, rhd, apple, ocircle, invneg, logof, varint, male, female, phone, clock, lightning, pointer, sun, bell, permil, smiley, various electrical symbols, shapes, music notes, circles, signs, astronomy, etc.
williams	latex3	Miscellaneous macros by Peter Williams.
win32	systems1	System binaries for Windows 32.
wnri	fonts3	METAFONT fonts for Old English, Indic languages in transcription, and American Indian languages.
wsuipa	fonts2	Washington State University IPA phonetic fonts
xtcpts	latex3	Defining language-depend text macros
xymtex	latex3	Typesetting chemical structures.
xypic	graphics2	A package for typesetting a variety of graphs and diagrams with TeX. Xy-pic works with most formats (including LaTeX, AMS-LaTeX, AMS-TeX, and plain TeX), in particular Xy-pic is provided as a L ^A T _E X2 _ε 'supported package'.
yannisgr	fonts3	Greek fonts by Yannis Haralambous
yfonts	latex2	A L ^A T _E X interface to the old-german fonts designed by Yannis Haralambous: Gotisch, Schwabacher, Fraktur and the baroque initials.
yhmath	latex3	Extended maths fonts for L ^A T _E X.
youngtab	latex3	A package for typesetting Young-Tableaux mathematical symbols for the representations of groups, providing two macros, \yng(\#1) and \young(\#1) to generate the whole Young-Tableaux.
yplan98	latex3	Print a vertical-type daily planner (i.e., months along the top, days downwards), with each 6-month period fitting onto a single A4 (or US letter) sheet.
ytex	formats3	Macro package developed at MIT.
zed-csp	latex3	Typesetting Z and CSP format specifications

Catalogue of Packages *continued*

<i>Package</i>	<i>Collection</i>	<i>Description</i>
zefonts	fonts2	Virtual T1 encoded Computer Modern fonts based on (OT1) Computer Modern, Times, and Helvetica fonts, intended to simulate 'dc' fonts. (Wayne Sullivan's 'dm' fonts are another approach to the substitution of 'dc' fonts by virtual ones.)
