

Does pdf \TeX make things better?

Hans Hagen — Pragma ADE

(February 1, 1999)

It's about ...

Typesetting paragraphs

Adjust or not adjust, ...

Two methods

Adjust spacing in double columns

Adjust spacing with emergency stretch

Look what happens

Only horizontal scaling

Fine tuning

Some observations

Typesetting paragraphs

\TeX is pretty strong in typesetting paragraphs, and instead of looking at individual lines, it treats such a paragraph as a whole. When typesetting a paragraph, \TeX

- ▶ tries to break lines without breaking words
- ▶ permits hyphenation within certain constraints
- ▶ stretches inter word spacing

As a bonus \pdf\TeX

- ▶ can fool the reader by changing glyphs

and thereby improves the grayness of the typeset page.

Adjust or not adjust, . . .

We can improve the look and feel of a typeset paragraph by slightly adjusting the shape of the glyphs:

- ▶ using glyphs with different width for similar characters
- ▶ stretching the horizontal ‘curves’ of glyphs
- ▶ scaling the glyphs in the horizontal direction
- ▶ moving interpunctuation and quotes into the margins

Herman Zapf’s method is mainly based on using a discrete set of glyphs for similar characters, while Hàn Thê Thàn’s pdf \TeX applies (discrete) horizontal scaling. At TUG98 Miroslava Misáková presented a combined strategy, using METAFONT to generate glyphs.

Two methods

Currently PDF_TE_X has two strategies built in. The first one does not influence the paragraph building. It simply stretches or shrinks lines that are under- or overfull.

The second method is interwoven with the paragraph builder and helps T_EX to find better line breaks, by offering alternative horizontal glyph scaling.

Both methods show the best results when used with multiple master fonts, but traditional type 1 fonts are handled pretty well too.

In the next examples the **colored text** is adjusted and layered over the ‘normal’ text. The first sample shows what happens when `\pdfadjustspacing` is set to 1, the other two show the results of setting it to 2.

Adjust spacing in double columns

Adjusting the spacing (or actually the glyphs) makes most sense in multi column mode. The mechanism is invoked by saying for instance:

```
\font\tenrm=cmr10 stretch 30 shrink 20 step 10
```

This means that the width of a glyph in this font be increased by at most 4% or deminished by at most 2%. because steps of 1% are taken, 7 different widths are possible. Individual glyphs can be influenced by setting its `\efcode`.

On the next pages, the top half of the screen shows the normal case, while the bottom half shows the adjusted text.

review, dip into, flip through, browse, glance into, leaf through, skim, refine, enumerate, glean, synthesize, winnow the wheat from the chaff and separate the sheep from the goats.

Fine tuning

Some glyphs are more sensitive to (even small) changes than others. Therefore PDF_TE_X permits you to influence stretching at the glyph level.

```
\efcode'W=500
```

```
\efcode'e=1250
```

This means that the **W** gets less than average stretch and shrink, while the **e** gets some more. Glyphs with many straight vertical lines are visually more sensitive to scaling than horizontal lines and curves.

The next examples show the consequences of setting the `\efcode`'s to values other than the default of 1000.

Stretch 90 - Expansion Codes

Some observations

- ▶ for centuries there have been examples of mixed width fonts
- ▶ once upon a time lead lines were simply squeezed upto, 1%
- ▶ there are examples of additional space saving ligatures
- ▶ in handwriting one can slow down and/or speed up
- ▶ there are $\text{T}_{\text{E}}\text{X}$ based optimizations on a per line/paragraph basis
- ▶ thereby one can stretch a ragged right or right aligned line
- ▶ but now $\text{pdfT}_{\text{E}}\text{X}$ can apply discrete horizontal scaling
- ▶ in general 5% is about the maximum amount to stretch
